

# Multivalued Function

A multivalued function, also known as a multiple-valued function (Knopp 1996, part 1 p. 103), is a "function" that assumes two or more distinct values in its **range** for at least one point in its **domain**. While these "functions" are not **functions** in the normal sense of being **one-to-one** or **many-to-one**, the usage is so common that there is no way to dislodge it. When considering multivalued functions, it is therefore necessary to refer to usual "functions" as **single-valued functions**.

While the **trigonometric**, **hyperbolic**, **exponential**, and integer **power** functions are all **single-valued functions**, their inverses are multivalued. For example, the function  $z^2$  maps each complex number  $z$  to a well-defined number  $z^2$ , while its **inverse function**  $\sqrt{z}$  maps, for example, the value  $z = 1$  to  $\sqrt{1} = \pm 1$ . While a unique **principal value** can be chosen for such functions (in this case, the **principal square root** is the positive one), the choices cannot be made **continuous** over the whole **complex plane**. Instead, lines of **discontinuity** must occur.

## **Iterations Of Multivalued Functions:**

**Iterations of Multi-valued Functions** Andrzej Smajdor, 1985      *Iterative Functional Equations* Marek Kuczma, Bogdan Choczewski, Roman Ger, 1990-07-27 A cohesive and comprehensive account of the modern theory of iterative functional equations Many of the results included have appeared before only in research literature making this an essential volume for all those working in functional equations and in such areas as dynamical systems and chaos to which the theory is closely related The authors introduce the reader to the theory and then explore the most recent developments and general results Fundamental notions such as the existence and uniqueness of solutions to the equations are stressed throughout as are applications of the theory to such areas as branching processes differential equations ergodic theory functional analysis and geometry Other topics covered include systems of linear and nonlinear equations of finite and infinite ORD various function classes conjugate and commutable functions linearization iterative roots of functions and special functional equations

*Computability and Complexity in Analysis* Jens Blanck, Vasco Brattka, 2001-05-23 This book constitutes the thoroughly refereed post proceedings of the 4th International Workshop on Computability and Complexity in Analysis CCA 2000 held in Swansea UK in September 2000 The 23 revised full papers presented together with a report on a competition of exact real arithmetic systems were carefully selected from 28 papers accepted for presentation during the workshop The book presents a cross section on current research on computability and complexity in analysis      **Functional Equations and**

**Inequalities in Several Variables** Stefan Czerwik, 2002 This book outlines the modern theory of functional equations and inequalities in several variables It consists of three parts The first is devoted to additive and convex functions defined on linear spaces with semilinear topologies In the second part the problems of stability of functional equations in the sense of Ulam Hyers Rassias and in some function spaces are considered In the last part the functional equations in set valued functions are dealt with for the first time in the mathematical literature The book contains many fresh results concerning those problems      *Iterative Methods for Solving Nonlinear Equations and Systems* Juan R. Torregrosa, Alicia

Cordero, Fazlollah Soleymani, 2019-12-06 Solving nonlinear equations in Banach spaces real or complex nonlinear equations nonlinear systems and nonlinear matrix equations among others is a non trivial task that involves many areas of science and technology Usually the solution is not directly affordable and require an approach using iterative algorithms This Special Issue focuses mainly on the design analysis of convergence and stability of new schemes for solving nonlinear problems and their application to practical problems Included papers study the following topics Methods for finding simple or multiple roots either with or without derivatives iterative methods for approximating different generalized inverses real or complex dynamics associated to the rational functions resulting from the application of an iterative method on a polynomial Additionally the analysis of the convergence has been carried out by means of different sufficient conditions assuring the local semilocal or global convergence This Special issue has allowed us to present the latest research results in the area of

iterative processes for solving nonlinear equations as well as systems and matrix equations In addition to the theoretical papers several manuscripts on signal processing nonlinear integral equations or partial differential equations reveal the connection between iterative methods and other branches of science and engineering

**Multi-Valued and Universal Binary Neurons** Igor Aizenberg, Naum N. Aizenberg, Joos P.L. Vandewalle, 2013-03-14 Multi Valued and Universal Binary Neurons deals with two new types of neurons multi valued neurons and universal binary neurons These neurons are based on complex number arithmetic and are hence much more powerful than the typical neurons used in artificial neural networks Therefore networks with such neurons exhibit a broad functionality They can not only realise threshold input output maps but can also implement any arbitrary Boolean function Two learning methods are presented whereby these networks can be trained easily The broad applicability of these networks is proven by several case studies in different fields of application image processing edge detection image enhancement super resolution pattern recognition face recognition and prediction The book is hence partitioned into three almost equally sized parts a mathematical study of the unique features of these new neurons learning of networks of such neurons and application of such neural networks Most of this work was developed by the first two authors over a period of more than 10 years and was only available in the Russian literature With this book we present the first comprehensive treatment of this important class of neural networks in the open Western literature Multi Valued and Universal Binary Neurons is intended for anyone with a scholarly interest in neural network theory applications and learning It will also be of interest to researchers and practitioners in the fields of image processing pattern recognition control and robotics

**Functional Analysis** N.B. Singh, This book Functional Analysis is designed for absolute beginners who want to understand the fundamental ideas of functional analysis without advanced prerequisites Starting from the basics it introduces concepts like vector spaces norms and linear operators using simple explanations and examples to build a strong foundation Each chapter breaks down complex topics step by step making it accessible for anyone new to the subject By the end readers will have a clear understanding of the core principles of functional analysis and how these ideas apply in mathematics physics and engineering

*Advances in Nuclear Science and Technology* Jeffery Lewins, Martin Becker, 2006-04-18 Some countries have moved beyond the design and operation of nuclear electricity generating systems to confronting the issue of nuclear waste disposal while others are still committed to further nuclear facility construction Volume 24 chronicles these key developments and examines nuclear reactor accidents at Chernobyl Bhopal and TMI The text also analyzes current international knowledge of neutron interactions deterministic methods based on mean values for assessing radiation distributions practical applications of the TIBERE models to explicit computation of leakage terms in realistic reactor geometry and a technique to deal with the issues of finance risk assessment and public perception

A History of Complex Dynamics Daniel S. Alexander, 2013-06-29 In late 1917 Pierre Fatou and Gaston Julia each announced several results regarding the iteration of rational functions of a single complex variable in the Comptes rendus of the French

Academy of Sciences These brief notes were the tip of an iceberg In 1918 Julia published a long and fascinating treatise on the subject which was followed in 1919 by an equally remarkable study the first installment of a three part memoir by Fatou Together these works form the bedrock of the contemporary study of complex dynamics This book had its genesis in a question put to me by Paul Blanchard Why did Fatou and Julia decide to study iteration As it turns out there is a very simple answer In 1915 the French Academy of Sciences announced that it would award its 1918 Grand Prix des Sciences mathematiques for the study of iteration However like many simple answers this one doesn't get at the whole truth and in fact leaves us with another equally interesting question Why did the Academy offer such a prize This study attempts to answer that last question and the answer I found was not the obvious one that came to mind namely that the Academy's interest in iteration was prompted by Henri Poincaré's use of iteration in his studies of celestial mechanics Numerical Methods for Experimental Mechanics Donald Berghaus, 2013-11-27 The purpose of this book is to place a resource in the hands of experimental mechanics researchers to enable them to understand and to obtain a working familiarity with certain of the numerical methods particularly useful to the field The book is organized to permit readers to study the methods and to observe their application in experimental problems It is also intended to encourage readers to directly apply the methods to the same problems or to similar problems of their choosing To this end computer programs are available electronically together with data for easy application Program listings are given in the appendix There are four chapters which make up the central coverage of the text The first of these deals with least square methods of problem solution both for curve fitting and for general solution of overdetermined problems Nonlinear least squares methods are included Secondly splines specifically smoothed splines are covered including specification of boundary conditions for the latter Use for differentiation is emphasized with attention to control of possible excesses in smoothing Transform methods are the third major area covered both the Discrete Fourier Transform and the Fast Fourier Transform Their combined use is described for appropriate problems Finally digital filters are included principally the Butterworth low pass filter Coverage also includes different filter orders high pass filters and the two pass filter technique The author has had experience with the four areas covered and with all of the example problems described in the text **Aspects of the Computational Theory for Certain Iterative**

**Methods** Ioannis K. Argyros, Saïd Hilout, 2009 *Iteration Theory (Ecit 91) - Proceedings Of The European Conference* J P Lampreia, Jaume Llibre, Christian Mira, Gyoergy Targonski, Jose Sousa Ramos, 1992-12-18 The main theme of the ECIT conferences is Iteration Theory on the borderline between Dynamics and Functional Equations The aim is to foster symbiosis between mainstream dynamics and iteration theory treated in the style of functional equations theory The following topics are focused turbulence and iteration characterization of chaos kneading theory symbolic dynamics bifurcation periods of maps topological dynamics discrete retarded dynamical systems cellular automata as dynamical systems iterative roots of formal power series iterative roots of polynomials phantom iterative roots iterative groups and semigroups families of

commuting functions algebraic aspects of iteration theory and functional equations

**Complex-Valued Neural Networks with Multi-Valued Neurons** Igor Aizenberg, 2011-06-24 Complex Valued Neural Networks have higher functionality learn faster and generalize better than their real valued counterparts This book is devoted to the Multi Valued Neuron MVN and MVN based neural networks It contains a comprehensive observation of MVN theory its learning and applications MVN is a complex valued neuron whose inputs and output are located on the unit circle Its activation function is a function only of argument phase of the weighted sum MVN derivative free learning is based on the error correction rule A single MVN can learn those input output mappings that are non linearly separable in the real domain Such classical non linearly separable problems as XOR and Parity  $n$  are the simplest that can be learned by a single MVN Another important advantage of MVN is a proper treatment of the phase information These properties of MVN become even more remarkable when this neuron is used as a basic one in neural networks The Multilayer Neural Network based on Multi Valued Neurons MLMVN is an MVN based feedforward neural network Its backpropagation learning algorithm is derivative free and based on the error correction rule It does not suffer from the local minima phenomenon MLMVN outperforms many other machine learning techniques in terms of learning speed network complexity and generalization capability when solving both benchmark and real world classification and prediction problems Another interesting application of MVN is its use as a basic neuron in multi state associative memories The book is addressed to those readers who develop theoretical fundamentals of neural networks and use neural networks for solving various real world problems It should also be very suitable for Ph D and graduate students pursuing their degrees in computational intelligence
