

Cellular Respiration Vocabulary

Word	Definition
ATP synthase	A cluster of several membrane proteins found in the mitochondrial crista (and bacterial plasma membrane) that function in chemiosmosis with adjacent electron transport chains, using the energy of a hydrogen ion concentration gradient to make ATP. ATP synthases provide a port through which hydrogen ions diffuse into the matrix of a mitochondrion.
acetyl coenzyme A	The entry compound for the Krebs cycle in cellular respiration; formed from a fragment of pyruvate attached to a coenzyme.
AMP/ADP/ATP	Stimulates allosteric enzyme (phosphofructokinase) that catalyzes step 3 of glycolysis. $\text{ADP} + \text{P} = \text{ATP}$ (dehydration synthesis). Potential energy (like a rechargeable battery).
anaerobic respiration	The use of inorganic molecules other than oxygen to accept electrons at the "downhill" end of electron transport chains.
beta oxidation	A metabolic sequence that breaks fatty acids down to two-carbon fragments which enter the Krebs cycle as acetyl CoA.
carbon dioxide	Let off during Krebs's Cycle.
chemiosmosis	An energy-coupling mechanism that uses energy stored in the form of a hydrogen ion gradient across a membrane to drive cellular work, such as the synthesis of ATP. Most ATP synthesis in cells occurs by chemiosmosis.
citric acid	6-Carbon molecule created during Krebs's Cycle composed of (2-C) Acetyl CoA and (4-C) Oxaloacetic Acid.
coenzyme	An organic molecule serving as a cofactor. Most vitamins function as coenzymes in important metabolic reactions.
cristae	An infolding of the inner membrane of a mitochondrion that houses the electron transport chain and the enzyme catalyzing the synthesis of ATP.
cytochrome	An iron-containing protein, a component of electron transport chains in mitochondria and chloroplasts.
electron transport chain	A sequence of electron carrier molecules (membrane proteins) that shuttle electrons during the redox reactions that release energy used to make ATP.
ethanol	Product of alcohol fermentation, a type of anaerobic fermentation. Pyruvate gets decarboxylated to ethanol.
facultative anaerobes	An organism that makes ATP by aerobic respiration if oxygen is present but that switches to fermentation under anaerobic conditions.
FADH/FADH₂	FADH has lower energy and is reduced to FADH ₂ which has higher energy. FADH (riboflavin) is an electron carrier created in Glycolysis and Krebs's Cycle and used to create a large amount of ATP in the Electron Transport Chain.
fermentation	A catabolic process that makes a limited amount of ATP from glucose without an electron transport chain and that produces a characteristic end product, such as ethyl alcohol or lactic acid.
glucose	Original reactant of Glycolysis and cellular respiration.
glycolysis	The splitting of glucose into pyruvate. Glycolysis is the one metabolic pathway that occurs in all living cells, serving as the starting point for fermentation or aerobic respiration.
Krebs's (Citric Acid) cycle	A chemical cycle involving eight steps that completes the metabolic breakdown of glucose molecules to carbon dioxide; occurs within the mitochondrion; the second major stage in cellular respiration.
lactic acid fermentation	The conversion of pyruvate to lactate with no release of carbon dioxide.
