

# The Cell Cycle

What controls the life and development of a cell?

## Why?

An old piece of poetry says "to everything there is a season... a time to be born, a time to die." For cells, the line might say "a time to divide and a time to grow." In multicellular organisms, different types of cells have different roles and need to complete specific tasks. For example, a cell that isn't large enough is not useful for storing nutrients for later, but a cell that is too large will not be useful for transportation through a tiny capillary. In this activity, you will learn about the seasons of a cell's life, and in turn better understand how organisms function.

## Model 1 – The Cell Cycle

1. How many phases are in the cell cycle as shown in the diagram in Model 1?
2. Starting at the starred cell, what is the order of the stages of a cell's life?
3. During which phase does the size of the cell increase?
4. During which phase does the number of cells increase?

## **What Controls The Cell Cycle Answer Meet:**

**Mathematical Modelling of the Cell Cycle Stress Response** Elahe Radmaneshfar, 2013-10-08 The cell cycle is a sequence of biochemical events that are controlled by complex but robust molecular machinery This enables cells to achieve accurate self reproduction under a broad range of conditions Environmental changes are transmitted by molecular signaling networks which coordinate their actions with the cell cycle This work presents the first description of two complementary computational models describing the influence of osmotic stress on the entire cell cycle of *S cerevisiae* Our models condense a vast amount of experimental evidence on the interaction of the cell cycle network components with the osmotic stress pathway Importantly it is only by considering the entire cell cycle that we are able to make a series of novel predictions which emerge from the coupling between the molecular components of different cell cycle phases The model based predictions are supported by experiments in *S cerevisiae* and moreover have recently been observed in other eukaryotes Furthermore our models reveal the mechanisms that emerge as a result of the interaction between the cell cycle and stress response networks
