The 74 revised full papers presented together with 5 plenary and invited papers were carefully reviewed and selected from numerous submissions. The papers are organized in topical sections on numerical modeling of fluids and structures, control and uncertain systems, Monte Carlo methods, theory, applications, and distributed computing, theoretical and algorithmic advances in transport problems, applications of metaheuristics to large scale problems, modeling and numerical simulation of processes in highly heterogeneous media, large scale models, numerical methods, parallel computations, and applications, numerical solvers on many-core systems, cloud and grid computing for resource-intensive scientific applications. Astrophysical Magnetic Fields Anvar Shukurov, Kandaswamy Subramanian, 2021-12-16 Magnetic fields permeate space and affect many major astrophysical phenomena, but they are often ignored due to their perceived complexity. This self-contained introduction to astrophysical magnetic fields provides both a comprehensive review of the current state of the subject and a critical discussion of the latest research. It presents our knowledge of magnetic fields from the Early Universe, their evolution in cosmic time, through to their roles in present-day galaxies, galaxy clusters, and the wider intergalactic medium, with attention given to both theory and observations. This volume also contains an extensive introduction into magnetohydrodynamics, numerous worked examples, observational and mathematical techniques, and interpretations of the observations. Its review of our current knowledge, with an emphasis on results that are likely to form the basis for future progress, benefits a broad audience of advanced students and active researchers, including those from fields such as cosmology and general relativity.
