

Bonding	Definition	Diagram	Properties
Ionic bonding / compounds	When a metal and a non-metal react together, the metal atom loses electrons to form a positively charged ion and the non-metal gains these electrons to form a negatively charged ion. These oppositely charged ions are strongly attracted by electrostatic forces. This attraction is called an ionic bond.	 <p>sodium ion, <math>\text{Na}^+</math> [2,8] <math>^+</math></p> <p>chloride ion, <math>\text{Cl}^-</math> [2,8,8] <math>^-</math></p>	<ul style="list-style-type: none"> <li>• Giant ionic lattice structure with very strong electrostatic forces between oppositely charged ions</li> <li>• High melting and boiling points due to strong bonds</li> <li>• When solid, they do not conduct electricity as the ions are held in place</li> <li>• When molten, they conduct electricity as the ions are free to move</li> <li>• When dissolved in water, they conduct electricity as the ions separate and so are free to move</li> </ul>
Covalent bonding - Simple molecular substances	When non-metal atoms bond together, they share pairs of electrons to make covalent bonds. The positive nuclei of the bonded atoms are attracted to the shared electrons by electrostatic forces.	 <p><b>CHEMISTRY C3</b></p> <p>Bonding, fullerenes, nanoparticles</p>	<ul style="list-style-type: none"> <li>• They have strong intramolecular forces but weak intermolecular forces</li> <li>• Low melting and boiling points due to the weak intermolecular forces</li> <li>• Gases or liquids (<math>\text{H}_2\text{O}</math>) at room temperature</li> <li>• They do not conduct electricity AT ALL because they aren't charged and have no free electrons or ions</li> </ul>
Covalent bonding - Giant covalent structures	(Same as above)  Two main examples made from Carbon atoms only: → Diamond (4 covalent bonds) → Graphite (3 covalent bonds)	 <p>Diamond</p> <p>Graphite</p>	<ul style="list-style-type: none"> <li>• High melting and boiling points as lots of energy is needed to break the covalent bonds between the atoms</li> <li>• They do not conduct electricity AT ALL as they do not contain charged particles (excluding graphite)</li> <li>• They are insoluble in water</li> <li>• They are hard</li> </ul>
Metallic bonding	Metals have delocalised electrons in the outer shell. There are strong forces of electrostatic forces between the positive metal ions and the shared negative ions.	 <p>Sea of electrons</p>	<ul style="list-style-type: none"> <li>• High melting and boiling points as the electrostatic force between the metals atoms and the delocalised sea of electrons is strong and needs a lot of energy to break.</li> <li>• Solid at room temperature</li> <li>• They conduct electricity and heat very well because they have delocalised electrons</li> <li>• They're malleable as the ions can slide over each other</li> </ul>
