

Day 4
Study Question
What causes the weather?

As well as temperature and wind, the sun also affects precipitation. As water absorbs heat from the sun, it warms and then it causes some of the water to evaporate into water vapor. The water vapor rises and increases humidity in the atmosphere, where it begins to cool. As it cools, the water condenses into droplets. The droplets collect in clouds, which get heavier and heavier until they can hold no more water. Finally, the water is released, and it falls to Earth as precipitation. This cycle of evaporation, condensation, and precipitation is called the water cycle.

Other combinations of temperature, wind, and precipitation can sometimes result in distinct weather events, such as tornadoes. These storm systems usually occur where two air masses of different levels of heat, pressure, and humidity meet. In that way, even the hottest, bluest of places are driven by the sun.

- A. Label each step in the water cycle, using the words *condensation*, *evaporation*, *precipitation*, and *water energy*.

- B. What other factors affect how air masses of different levels of heat, pressure, and humidity meet?
