**Quantum Structures in Cognitive and Social Science** Diederik Aerts,Jan Broekaert,Liane Gabora,Sandro Sozzo,2016-06-26 Traditional approaches to cognitive psychology correspond with a classical view of logic and probability theory More specifically one typically assumes that cognitive processes of human thought are founded on the Boolean structures of classical logic while the probabilistic aspects of these processes are based on the Kolmogorovian structures of classical probability theory However growing experimental evidence indicates that the models founded on classical structures systematically fail when human decisions are at stake These experimental deviations from classical behavior have been called paradoxes fallacies effects or contradictions depending on the specific situation where they appear But they involve a broad spectrum of cognitive and social science domains ranging from conceptual combination to decision making under uncertainty behavioral economics and linguistics This situation has constituted a serious drawback to the development of various disciplines like cognitive science linguistics artificial intelligence economic modeling and behavioral finance A different approach to cognitive psychology initiated two decades ago has meanwhile matured into a new domain of research called quantum cognition Its main feature is the use of the mathematical formalism of quantum theory as modeling tool for these cognitive situations where traditional classically based approaches fail Quantum cognition has recently attracted the interest of important journals and editing houses academic and funding institutions popular science and media Specifically within a quantum cognition approach one assumes that human decisions do not necessarily obey the rules of Boolean logic and Kolmogorovian probability and can on the contrary be modeled by the quantum mechanical formalism

Different concrete quantum theoretic models have meanwhile been developed that successfully represent the cognitive situations that are classically problematical by explaining observed deviations from classicality in terms of genuine quantum effects such as contextuality emergence interference superposition entanglement and indistinguishability In addition the validity of these quantum models is convincingly confirmed by new experimental tests We also stress that since the use of a quantum theoretic framework is mainly for modeling purposes the identification of quantum structures in cognitive processes does not presuppose without being incompatible with it the existence of microscopic quantum processes in the human brain In this Research Topic we review the major achievements that have been obtained in quantum cognition by providing an accurate picture of the state of the art of this emerging discipline Our overview does not pretend to be either complete or exhaustive But we aim to introduce psychologists and social scientists to this challenging new research area encouraging them at the same time to consider its promising results It is our opinion that if continuous progress in this domain can be realized quantum cognition can constitute an important breakthrough in cognitive psychology and potentially open the way towards a new scientific paradigm in social science [Advances in Asphalt Emulsion Materials for Cold Paving Technologies](#)

**Approach** David E. Traul,Irene P. Osborn,2018-10-15 Neuroanesthesia A Problem Based Learning Approach provides an up to date and comprehensive review of the neuroanesthesia subspecialty Its problem based format incorporates a pool of practical multiple choice questions for self assessment Each of its 29 case based chapters is accompanied by 10 questions and answers accessible online in a full practice exam The cases presented are also unique as each chapter starts with a case description usually a compilation of several actual cases it then branches out through case based questions to increasingly complex situations This structure is designed to create an authentic experience that mirrors that of an oral board examination The discussion sections that follow offer a comprehensive approach to the chapter s subject matter thus creating a modern complete and up to date medical review of that topic This book is equally a solid reference compendium of neuroanesthesia topics and a comprehensive review to assist the general practitioner both in day to day practice and during preparation for certification exams Its problem based format makes it an ideal resource for the lifelong learner and the modern realities of education [Brain Networks for Studying Healthy and Pathological Aging Mechanisms and Intervention Efficacy](#) Christos Frantzidis,Ana B. Vivas,Panagiotis D. Bamidis,2020-11-18 Previous studies showed that both healthy and

pathological aging are associated with changes in brain structure and function of the mature human brain. The most prominent anatomical alterations are changes in prefrontal cortex morphology, volume loss, and reduced white matter integrity and hippocampal atrophy. Cognitive decline affects mainly the performance of episodic memory, speed of sensory information processing, working memory, inhibitory function, and long-term memory. It has been also proposed that due to the aforementioned changes, the aging brain engages in compensatory brain mechanisms such as a broader activation of cortical regions, mainly frontal, rather than specialized activation. Evidence suggests that similar changes occur with pathological aging but to a greater extent. In this case, information flow is disrupted due to neurodegeneration; functional activation of posterior occipito-temporal regions is decreased, and as a consequence, the brain fails to process sensorial input in the ventral pathway, and cognitive deficits appear. In the last years, functional alterations associated with aging have been studied using the mathematical notion of graph theory that offers an integrative approach since it examines different properties of the brain network: 1. Organization level, 2. amount of local information processing, 3. information flow, 4. cortical community structure, and 5. identification of functional anatomical hubs. So graph theory offers an attractive way to model brain networks organization and to quantify their pathological deviations. Previous studies have already employed this mathematical notion and demonstrated that age-related neurodegeneration is often accompanied by loss of optimal network organization, either due to diminished local information processing or due to progressive isolation of distant brain regions. They have also found that changes in network properties may be present even in the preclinical phase, which could be taken as a biological marker of disease.

**Research in Education**, 1969-05      Neuronal Self-Defense: Compensatory Mechanisms in Neurodegenerative Disorders Rosanna Parlato, Pier Giorgio Mastroberardino, 2016-02-26. Neurodegenerative disorders are characterized by the progressive loss of specific populations of neurons with consequent deterioration of brain's function and dramatic impact on human behavior. At present, there are no effective cures for neurodegenerative diseases. Because unambiguous diagnosis is possible only after manifestation of symptoms, when a large proportion of neurons has been already lost, therapies are necessarily confined to alleviation of symptoms. Development of cures halting the disease course is hampered by our rudimentary understanding of the etiopathology. Most neurodegenerative disorders are sporadic and age-related, and even for those of known genetic origin, the mechanisms influencing disease onset and progression have not been fully characterized. The different diseases, however, share important similarities in the mechanisms responsible for neuronal loss, which is caused by a combination of endogenous and exogenous challenges. Trophic deprivation, oxidative stress, accumulation of abnormal protein aggregates, and bioenergetics defects have been described in most, if not all, neurodegenerative diseases. To counterbalance these noxious stimuli, cells deploy at least during the initial pathogenic states intrinsic neuroprotective responses. These are general compensatory mechanisms common to several neurodegenerative conditions which reprogram cellular physiology to overcome stress. Adaptation includes strategies to optimize energetic

resources for instance reduction of rRNA synthesis to repress translation suppression of transcription and bioenergetics and metabolic redesign Additional mechanisms include potentiation of antioxidant capacity induction of endoplasmic reticulum ER stress and activation of protein quality control systems and autophagy Ineffective execution of these compensatory strategies severely threatens cellular homeostasis and favors onset of pathology Therefore a better understanding of these buffering mechanisms and of their interconnections may help to devise more effective therapeutic tools to prolong neuronal survival and activity independently of the original genetic mutations and stress insults This Research Topic focuses on the initial compensatory responses protecting against failure of those mechanisms that sustain neuronal survival and activity The collection intends to summarize the state of the art in this field and to propose novel research contributes with the ultimate goal of inspiring innovative studies aimed to contrast progression of neurodegenerative diseases Resources in Education
