**Targets for the Treatment of Chronic Pain** Milica S. Prostran,Francisco R. Nieto,Sonja Maksim Vuckovic,2020-12-03

Acute pain has a physiological protective role in preventing tissue damage However pain can become chronic due to a multitude of pathophysiological states such as trauma inflammation neural injury viral infection cancer autoimmune diseases and vascular and metabolic disorders These pathological states can trigger alterations of the pain pathways that can lead to hypersensitivity and in such circumstances pain loses its protective role and instead becomes persistent and debilitating affecting seriously to the quality of life of patients Chronic pain is one of the most important health problems worldwide It has been estimated that 10% of adults are diagnosed with chronic pain each year However despite the high prevalence of chronic pain its management is still no fully satisfactory probably due to the variety of chronic pain conditions with different etiologies neuropathic visceral and musculoskeletal pain and because their pathophysiological mechanisms are only partially known Therefore there is a huge need for new effective therapies for the control and or prevention of the different types of chronic pain Chronic pain is associated with plastic changes in pain circuits of the peripheral and central nervous system including changes in the expression of ion channels neurotransmitters and receptors In addition there is growing consensus on non neuronal mechanisms that can amplify or resolve chronic pain and cells traditionally thought to act just as coordinators of the inflammatory response such as immune and glial cells are now accepted as real modulators of pain signaling In this regard animal models of persistent pain such as models of neuropathic and visceral pain and models of arthritis are helping to elucidate our understanding of the pathogenesis of chronic pain and make it possible to test experimental treatments

*Regulatory RNAs in the Nervous System, 2nd Edition* Tommaso Pizzorusso, Alessandro Cellerino, Laure  
Bally-Cuif, 2018-11-13 Until about a decade ago the non coding part of the genome was considered without function RNA sequencing studies have shown however that a considerable part of the non coding genome is transcribed and that these non coding RNAs nc RNAs can regulate gene expression Almost on weekly basis new findings reveal the regulatory role of nc RNAs exert in many biological processes Overall these studies are making increasingly clear that both in model organisms and in humans complexity is not a function of the number of protein coding genes but results from the possibility of using combinations of genetic programs and controlling their spatial and temporal regulation during development senescence and

in disease by regulatory RNAs This has generated a novel picture of gene regulatory networks where regulatory nc RNAs represent novel layers of regulation Particularly well characterized is the role of microRNAs miRNAs small nc RNAs that bind to mRNAs and regulate gene expression after transcription This message is particularly clear in the nervous system where miRNAs have been involved in regulating cellular pathways controlling fundamental functions during development synaptic plasticity and in neurodegenerative disease It has also been shown that neuronal miRNAs are tightly regulated by electrical activity at the level of transcription biogenesis stability and specifically targeted to dendrites and synapses Deregulation of expression of miRNAs is proposed not only as potential disease biomarker but it has been implicated directly in the pathogenesis of complex neurodegenerative disease This so called RNA revolution also lead to the exploitation of RNA interference and the development of related tools as potential treatment of a vast array of CNS disease that could benefit from regulation of disease associated genes In spite of these advancements the relatively young age of this field together with the inherent high molecular complexity of RNA regulation of biological processes have somewhat hindered its communication to the whole of the neuroscience community This Research Topic aims at improving this aspect by putting around the same virtual table scientists covering aspects ranging from basic molecular mechanisms of regulatory RNAs in the nervous system to the analysis of the role of specific regulatory RNAs in neurobiological processes of development plasticity and aging Furthermore we included papers analyzing the role of regulatory RNAs in disease models from neuromuscular to higher cognitive functions and more technically oriented papers dealing with new methodologies to study regulatory RNA biology and its translational potential *Computational Epigenetics and Diseases* ,2019-02-06
