

## CHAPTER-13 ORGANISMS AND POPULATIONS

Ecology is the branch of biology that deals with the inter-relationship amongst the organisms and their environment. Study of ecology is important to strike a balance between development and maintenance of natural environmental and biotic communities, use and conservation of resources, solve local regional and global environmental problems.

- **Applied ecology** is the study of specialized field of ecology which are concerned with conservation and economic exploitation of organisms. Example- agronomy, wild life management etc.
- **System ecology** deals with interpretation of ecological concepts and processes in terms of mathematical models of formulae.
- **Genecology** is the study of genetic composition and changes in relation to the origin of ecades, ecotypes, new species etc.
- **Ecological hierarchy** or ecological level of organization connected with ecological grouping of organisms.

The sum total of all biotic and abiotic factors, substances and conditions that surround and potentially influence organisms without becoming their constituent part is called environment.

### Organism and its Environment

- At organism level, physiological ecology tries to understand how different organisms are adapted to their environment in terms of survival and reproduction. The variation in the intensity and duration of temperature along with annual variations in precipitation results in formation of major biomes like desert, rain forest and tundra.
- Regional and local variations within each biome lead to the formation of different kinds of habitats like tropical rain forest, deciduous forest, desert, sea coast etc.
