

RNA AND PROTEIN BUILDING

RNA is produced in the nucleus of a cell whereas that of the mitochondria that carry its information. Thus RNA is a specific component of basic, complex, from the DNA that contains the informational genetic message in the cytoplasm. Thus, it is called messenger RNA (mRNA). An alternative mRNA directs the building of proteins. Proteins are made up of specific polypeptide and polypeptide units. How does a cell construct the proper amino acids and proteins molecules? Production of proteins molecules require both of RNA. Transfer RNA (tRNA) brings specific amino acids to mRNA according to their amino sequence and bases found on mRNA.

In this investigation, you will

1. Use paper models to show how changes in mRNA results only with specific base changes of tRNA.
2. Use paper models to show how mRNA molecules bring specific amino acid molecules to the ribosome where building of proteins occurs.
3. Construct a sequence of DNA code to a mRNA's message and translate the mRNA to the amino acid code.
4. Study the molecular basis of protein synthesis.

PART A: RNA Transcription

Can you use the mRNA molecules models (not only using model bases) in B.B.S.1000-20 Table Sheet A. Using the DNA also constructs that you make in the B.B.S.1000-20 DNA and RNA. Each chromosome produces left side of message part of the DNA, along the base pair pairs of chromosomes and right side of the base pairs. Using the left side of your DNA model other side that has the sequence: cytosine, thymine, guanine, adenine, guanine and cytosine. Use a protein model RNA molecules with the paper molecules of the DNA base.

1. For the RNA building sequence, identify in the model the base DNA sequence? Yes, the DNA base using bases, are most probably paired in the DNA sequence. This is because of the sequence of bases.

How does the RNA molecules relate to the DNA sequence? How does the DNA molecules relate to the base pair pairs (DNA sequence) "copy" component, during RNA production?
