immune system is not only an interesting information system but it may provide a design paradigm for artificial information systems. With such a consideration I initiated a project titled autonomous decentralized recognition mechanism of the immune network and its application to distributed information processing in 1990 under a Grant in Aid for Scientific Research on a Priority Area Autonomous Distributed Systems supported by the Ministry of Education Science and Culture. During the project I promoted the idea that the immune system could be a prototype of autonomous distributed systems. After the project we organized an international workshop on immunity based systems in 1996 in conjunction with the International Conference on Multi Agent Systems held in Kyoto Japan. Recently there have been several international conferences related to topics inspired by the immune system and an increasing number of research papers related to the topic. In writing this book a decade after the project I still believe that the immune system can be a prototype a compact but sophisticated system that nature has shown us for building artificial information systems in this network age of the twenty first century. **33**
