The third edition *Traveler Response to Transportation System Changes Handbook* provides comprehensive information on travel demand effects of alternative urban transportation policies, operating approaches and systems, and built environment options by building upon, expanding, and selectively replacing the earlier editions to provide a contemporary assessment of the experience and insights gained from the application and analysis of various system changes and alternatives. The focus is on aiding transportation transit and land use planners in their conduct of travel demand and related analyses and to inform elected officials, administrators, operators, designers, and the general public as well. The *Traveler Response to Transportation System Changes Handbook* consists of the Chapter 1 introductory materials and 15 stand-alone published topic area chapters. Each topic area chapter provides traveler response findings, including supportive information and interpretation, and also includes case studies and a bibliography consisting of the references utilized as sources. Please note that Chapters 4, 7, and 8 have been deferred for a future TCRP project effort. The Handbook findings derive primarily from reported results and analyses of real world transportation system and policy applications and trials. Experimental or quasi-experimental empirical data have been the information source of choice. Other empirical data derivations and simple accounts of outcomes have been employed as necessary. Forecasts and other estimates derived from travel demand model applications and similar techniques have been used but on a very selective basis, mostly for augmenting the empirical data where gaps exist and for providing additional insights and context. TCRP Report 95 *Traveler Response to Transportation System Changes Handbook* will be of interest to transit, transportation, and land use planning practitioners, transportation engineers, land developers, employers, and school administrators, researchers, and educators, and professionals across a broad spectrum of transportation and planning metropolitan planning organizations and local, state, and federal government agencies. A User Acceptance of Web Personalization Systems Dr. Fendi Ameen,2014-10-09 Research on web personalization techniques for collecting and analysing web data in order to deliver personalized information to users is in an advanced state Many metrics from the computational intelligence field have been developed to evaluate the algorithmic performance of Web

Personalization Systems WPSs However measuring the success of a WPS in terms of user acceptance is difficult until the WPS is deployed in practice In summary many techniques exist for delivering personalized information to a user but a comprehensive measure of the success in WPSs in terms of human interaction and behaviour does not exist This study aims to develop a framework for measuring user acceptance of WPSs from a user perspective The proposed framework is based on the unified theory of acceptance and use of technology UTAUT The antecedents of user acceptance are described by indicators based on four key constructs i e performance expectancy PE effort expectancy EE social influence SI and facilitating conditions FC All these constructs are underpinned by Information Systems IS theories that determine the intention to use BI and the actual use USE of a technology A user acceptance model was proposed and validated using structural equation modelling SEM via the partial least squares path modelling PLS PM Four user characteristics i e gender age skill and experience have been chosen for testing the moderating effects of the four constructs The relationship between the four constructs in regard to BI and USE has been validated through moderating effects in order to present an overall view of the extent of user acceptance of a WPS Results from response data analysis show that the acceptance of a WPS is determined through PE EE SI and FC The gender of a user was found to moderate the relationship between performance expectancy of a WPS and their behavioural intention in using a WPS The effect of behavioural intention on the use of WPS is higher for a group of females than for males Furthermore the proposed model has been tested and validated for its explanation power of the model and effect size The current study concluded that predictive relevance of intention to use a WPS is more effective than the actual WPS usage which indicated that intention to use has more prediction power for describing a user acceptance of a WPS The implications of these measures from the computational intelligent point of view are useful when a WPS is implemented For example the designer of a WPS should consider personalized design features that enable the delivery of relevant information sharing to other users and accessibility across many platforms Such features create a better web experience and a complete security policy These measures can be utilized to obtain a higher attention rate and continued use by a user the features that define user acceptance of a WPS

Automatic Generation of Morphological Set Recognition Algorithms Robert C.

Vogt,2012-12-06 Since the early days of computers machine learning and automatic programming have attracted researchers in computer science and related fields particularly pattern recognition and automatic control theory Most of the learning concepts in machine perception have been inspired by pattern recognition approaches that rely on statistical techniques These statistical techniques have applicability in limited recognition tasks Automatic programming in perception systems has generally been limited to interfaces that allow easy specification of the task using natural language Clearly machine learning and automatic programming can make perception systems powerful and easy to use Vogt s book addresses both these tasks in the context of machine vision He uses morphological operations to implement his approach which was developed for solving the figure ground problem in images His system selects the correct sequence of operators to accept or reject pixels for finding objects in an image The sequence of operators is selected after a user specifies what the correct objects are On the surface it may appear that the problem solved by the system is not very interesting however the contribution of Vogt s work should not be judged by the images that the system can segment Its real contribution is in demonstrating possibly for the first time that automatic programming is possible in computer vision systems The selection of morphological operators demonstrates that to implement an automatic programming based approach operators whose behavior is clearly defined in the image space are required
