Arema Manual Pandrol On Timber Ties:

Railway Track and Structures, 1998 **Experimental Analysis of Timber Railroad Ties** Ruben A. Diaz, 2016

Wooden railroads ties have been historically the most common type used in North America to their availability and economy. Hardwood ties are generally preferred for their durability over softwood ties. Ties must carry bending moments and compressive forces developed by train loads. This thesis presents an experimental research study conducted to evaluate the mechanical behavior of wooden railroad ties based on the American Railway Engineering and Maintenance of Way Association AREMA Chapter 30 evaluation testing regimen. The tests performed include Bending Center Negative evaluates the tie center negative flexural bending performance. Bending Railseat Positive evaluates the railseat positive flexural bending performance. Railseat Compression evaluates the ability to resist railseat loads and the modified Janka ball test measures resistance to denting and wear. Four wood species were evaluated and compared including Douglas Fir Southern Yellow Pine Ponderosa Pine and Hardwood unknown species. A total of 11 ties were tested. New Mexico ponderosa pine is characteristic of slow growth due to scarce rain. The slow growth induce a denser wood compared to fast growing ponderosa pine from Colorado. Local timber producers are exploring the viability of using New Mexico grown ponderosa pine ties. Prior to testing ties were physically appraised in accordance with AREMA to determine unwanted defects. Test results indicated that all ties satisfy the minimum requirements set by AREMA. Comparison of test results concluded in an overall better performance for Hardwood samples among all ties tested.
