**KEY WORD**

**amphibian** *creatures who spend part of their lives in water and part of it on land*

**Class Amphibia**

This class includes the amphibians (frogs, toads, newts and salamanders). The word **amphibian** comes from two Greek words *amphi*, which means both, and *bios*, which means life. This means that amphibians spend part of their lives (as larvae or tadpoles) in water and part of it (as adults) on land.

The amphibians were the first vertebrates to colonise the land. They have simple sac-like lungs (which are not very efficient) and smooth, moist skin, which is also used as a respiratory surface. Their lifecycle includes metamorphosis, and they need water for successful reproduction as fertilisation is external and the larval form (tadpole) is aquatic. Gills are only present in the larval forms. Amphibians are ectothermic – they rely on heat from their environment to regulate their body temperature. Worldwide there are many concerns about the survival of the amphibian class, because a pathogenic fungus has emerged that is killing them in their millions, driving species to extinction particularly in the Americas and Australia. Combined with the loss of habitat that is also occurring and the pollution, which is becoming a problem all over the world, scientists are very worried about the future of amphibians. There is a genus of toads containing two species known as Ethiopian toads (*Altiphrynoides*), which are found mainly in the mountains in the south and centre of our country.

**Figure 5.23** The Ethiopian banana frog, *Afrixalus enseticola*, is tiny and, like many amphibians, vulnerable to extinction.
