

CHAPTER 5 THE CLUTCH

- 5.1 Description
- 5.2 Routine maintenance
- 5.3 Removing and dismantling clutch

5.1 Description

A single dry plate clutch of diaphragm spring type is fitted, the main components being the driven plate, pressure plate assembly and release bearing.

The driven plate consists of a resistant steel disc attached to a hub which slides on the splined gearbox input shaft. The friction linings are riveted to both sides of the disc. The pressure plate assembly consists of the pressure plate, diaphragm spring and housing, the housing being attached to the rear face of the engine flywheel. The release bearing is a ballbearing of special construction with an elongated outer ring that presses directly against the diaphragm spring when the clutch pedal is operated.

The clutch operating mechanism is hydraulic, the clutch pedal actuating a master cylinder where pressure on the fluid is generated, this pressure being transmitted through a hose to the clutch slave cylinder mounted on the clutch housing. Slave cylinder action is transmitted to the release bearing by a release lever. On some models the release lever is fully enclosed inside the clutch housing, on others it operates through a hole in the side of the housing.

When the clutch is fully engaged, the driven plate is clamped between the pressure plate and the flywheel and

- 5.5 Servicing hydraulic system
- 5.6 Fault diagnosis

transmits torque to the gearbox by turning the splined input shaft. When the clutch pedal is depressed the pressure plate is withdrawn from the driven plate by hydraulic pressure, the driven plate then ceasing to transmit torque.

5.2 Routine maintenance

As the clutch operating mechanism is self-adjusting, no routine maintenance is required apart from a regular check on the level of hydraulic fluid in the system. The clutch and forks/hydraulic systems share a common fluid reservoir, topping up being carried out as described in Chapter 11.

Checking clutch plate wear

It is possible to make a simple check on clutch driven plate friction lining wear, without the need for component dismantling.

Models with external release lever

Working from beneath the car, pass the release lever in a forward direction until it touches the wear face (see FIG 5.1). With a new clutch driven plate, dimension A

FIG 5.1 Checking friction lining wear: models with external release lever

FIG 5.2 Checking friction lining wear: models with internal release lever

FIG 5.3 Coverplate attachment

FIG 5.4 Removing clutch assembly from flywheel

should be 17 to 18mm (0.67 to 0.70in), measured at the plate cylinder pinhead. If this dimension is less than 16mm (0.63in), the driven plate should be renewed.

Models with internal release lever

Checking on these models must be carried out using special tool BMW 7007 (see FIG 5.2). If the tool can be inserted into the opening on the slave cylinder as far as to handle, as shown in the illustration, sufficient driven plate lining thickness exists for further service. If a gap of approximately 16mm (0.63in) remains between the gauge handle and slave cylinder as shown at A, the friction linings are worn to the limit and a new driven plate must be fitted.

5.3 Removing and dismantling clutch

Refer to Section 5.5 and remove the slave cylinder but do not disconnect the fluid hose. With the slave cylinder in the preliminary to growth stage on the hose, remove the gearbox as described in Chapter 8.

On models fitted with an external clutch release lever, loosen the clutch housing, housing bolts, then refer to FIG 5.2 and remove the coverplate. Remove the clutch housing. On models fitted with an internal clutch release lever, remove the lining bolts and detach the clutch housing.

Refer to FIG 5.4. Lock the flywheel against rotation using tool BMW 7007 or other suitable means, then mark the relationship of the clutch cover to engine flywheel so that it can be easily realigned to regain the original balance when refitted. Breaken the clutch cover retaining bolts (arrowed), alternately and evenly until spring pressure is released. Remove the bolts and lift off the clutch pressure plate assembly and driven plate, taking care not to get grease or oil on to the friction linings.

To remove the release bearing on models fitted with external release lever, refer to FIG 5.5 and lift the spring ends over spherical pin roller. Take care not to damage angular seal 1. Remove the seal and bearing assembly by pulling to the left as shown in FIG 5.6. Disconnect the bearing from the splining springs as shown in FIG 5.7.
