Engine Committee, 1964 *Development of a Fuel Filter and Water Separator for Diesel Engines* Vernon D. Roosa, David H. Hodgkins, Society of Automotive Engineers, 1972 *Fuel Filter Plugging by Insoluble Sediment in Diesel Fuels* Reddy, SR., 1988 Diesel fuels contaminated with insoluble sediment and water have caused problems for light duty diesel engines by plugging fuel filters The sediment consists of either aggregated gum particles resulting from fuel oxidation

or biological slime produced by micro organisms that grow at the water fuel interface Laboratory experiments were conducted to understand the mechanism of filter plugging by these sediments Gum particles tend to be hard and spherical in shape while biological growth tends to consist of long stringy fibrous material Biological slime plugged both the 10 m engine filter and the 130 m tank sock filter gum particles which individually were less than 3 m in diameter plugged the 10 m engine filter by forming aggregates of several hundred particles these aggregates readily passed through the 130 m tank sock filter However plugging with these aggregates was not very severe because a porous cake formed on the surface of the filter paper that allowed some fuel to flow Filter plugging was very severe when gummy fuel was contaminated with water because the particles flocculated and plugged both of the filters Prevention of water contamination and treatment of diesel fuel with additives to prevent gum and biological growth formation are necessary to avoid filter plugging problems

Fuel Filter Test Methods Filter Test Methods Standards Committee,1999 The purpose of this fuel filter test method is to provide standardized methods for evaluating the performance characteristics of fuel filters by bench test methods This combined with data obtained from application tests may be used to establish standards of performance for filters when tested by these standard methods Many variations in requirements of filtration to protect fuel supply equipment on engines and variations in operating conditions make it difficult to specify meaningful in service performance standards by which a filter may be judged By the use of these standard test methods test conditions are always the same and comparisons of the laboratory performance of filters may be made with a high degree of confidence Once the requirements of a particular application are known performance standards for suitable filters may be established by these test methods and adequacy of performance of filters for the job may be determined In order to achieve the highest degree of reliability of test results the procedures and equipment must conform to those specified in this code No minimum performance requirements for filters have been specified since these are the responsibility of the user and manufacturer Only the methods of determining interpreting and reporting performance characteristics are the proper province of this SAE Recommended Practice

Addressing the Issue of Fuel Filter Fouling with Recent Changes in Fuel Quality Paul Richards, Jim Barker, Stephen Cook, 2009 The recent introduction of biodiesel blends to the U S market has coincided with an increase in the reported problems of fouling of fuel filters and fuel injection equipment manifested in power loss noise vibration and increased filter changes However the introduction of biodiesel has to a large extent coincided with the introduction of ultra low sulfur diesel fuel and changes in engine technology leading to higher fuel injection pressures It is thus proposed that current incidences of fouling are not a problem brought about solely as a result of the introduction of biodiesel A review of known fuel degradation mechanisms suggests that the effects of increased fuel pressure and also high shear environments should be examined as a probable cause of increasing deposit formation Deposit formation on both fuel filters and injectors has previously been attributed to a variety of sources including Biological contamination both aerobic and non aerobic water contamination adulteration with lubricating oil fuel additive interactions and biodiesel degradation The deposits currently being encountered appear to be more akin to the high carbon content particles found in diesel exhaust than those previously described and are frequently found in the presence of deposit precursor molecules This paper concentrates on the issue of fuel filter fouling presents the analysis of currently encountered deposits relates these results to some of the degradation mechanisms alluded to above and suggests possible precursor molecules in fuels both pre and post stressing to support the proposed mechanisms It is also shown that existing fuel quality tests do not correlate well with reported fouling propensity suggesting that new test methods are required to ensure future fuels are fit for purpose
