The Problem Solver

A furnace is not a household appliance. It is complex and requires professional maintenance and repair.

That's why attempts at "do-it-yourself" repairs on an in-warranty unit may void the remainder of your warranty.

Other than performing the simple maintenance recommended in this manual, you should not attempt to make any adjustments to your furnace. Your dealer will be able to take

care of any questions or problems you may have. A periodic inspection of your furnace should be made by a qualified service agency at the start of each heating season.

Keep your furnace looking like new for years.

Clean the enamel finish of your furnace with ordinary soap and water. For stubborn grease spots, use a household detergent. Lacquer thinner or other synthetic solvents may damage the finish.

Save time and money. Before calling for service, check the following:

Problem	Possible Trouble	Possible Remedy
No Heating – Blower does not operate.	1. Thermostat set incorrectly. 2. Blown fuse or tripped circuit breaker. 3. Defective component. 4. Burner does not ignite. 5. Main gas line turned off. 6. Blower door removed or ajar. 7. Lockout	1. Adjust thermostat. See operating instructions. 2. Replace or reset protective device or call for service. 3. Most controls are automatic and will recycle. If your unit still does not operate call for service. 4. Call service. 5. Have gas company check. 6. Close door securely to restore power to blower and gas valve. 7. Turn power on-off-on-off twice in 30 seconds.

Aquatic Disposal Field Investigations, Galveston, Texas, Offshore Disposal Site Thomas D. Wright, David B. Mathis, James M. Brannon, 1978 This study was part of an investigation to determine the environmental effects of offshore dredged material disposal at Galveston, Texas. The biological portion of the study was conducted in two phases: a pilot survey

of the dredged material disposal site DMDS to determine the areal distribution of the biota and sediments and an experimental study to assess the effect of dredged material disposal on the biota at selected sites in the DMDS Three experimental sites were investigated a sandy bottom that received sand shell and silt clay dredged material a muddy bottom that received sand and shell dredged material and a muddy bottom that received silt clay dredged material The magnitude of the effect on the benthic populations could not be accurately assessed because adequate predisposal data on natural sediment and benthic population changes were not available Dredged material deposits had no apparent effect on feeding habits of fish or on the distribution of nekton although some nektonic species may have congregated in the turbid water following dredged material disposal Zooplankton and phytoplankton studies detected no population changes during disposal that could not have been due to sampling error It is probable that sudden abiotic changes and commercial fishing activities cause more destruction of biota than dredging related activities
