Ashrae Advanced Energy Design Guide:

Advanced Energy Design Guide for Small to Medium Office Buildings, 2011 Advanced Energy Design Guide for Small to Medium Office Buildings is the first in a series designed to provide recommendations for achieving 50% energy savings over the minimum code requirements of ANSI ASHRAE IESNA Standard 90.1-2004. The energy savings target of 50% is the next step toward achieving a net zero energy building which is defined as a building that on an annual basis draws from outside resources equal or less energy than it provides using on site renewable energy sources. ANSI ASHRAE IESNA Standard 90.1-2004 provides the fixed reference point and serves as a consistent baseline and scale for all of the 50% Advanced Energy Design Guides. This Guide focuses on small to medium office buildings up to 100,000 ft². Office buildings include a wide range of office types and related activities such as administrative, professional, government, bank or other financial services and medical offices without medical diagnostic equipment. These facilities typically include all or some of the following space types: open plan and private offices, conference and meeting spaces, corridors and transition areas, lounge and recreation areas, lobbies, active storage areas, restrooms, mechanical and electrical rooms, stairways and other spaces. This Guide does not cover specialty spaces such as data centers which are more typical in large office buildings. The specific energy saving recommendations in this Guide are summarized in a single table for each climate zone and will allow contractors, consulting engineers, architects and designers to easily achieve advanced levels of energy savings without detailed energy modeling or analyses. In addition, this Guide provides a greater emphasis on integrated design as a necessary component in achieving 50% energy savings and devotes an entire chapter to integrated design strategies that can be used by teams who do not wish to follow the specific energy saving recommendations.

Advanced Energy Design Guide for K-12 School Buildings
ASHRAE (Firm), 2018 Provides recommendations for achieving a net zero energy K-12 school building. Allows contractors, consulting engineers, architects and designers to easily achieve advanced levels of energy savings without resorting to detailed calculations or analyses.

Air-conditioning System Design Manual Walter T. Grondzik, 2007 The Air Conditioning Manual assists entry level engineers in the design of air conditioning systems. It is also usable in conjunction with fundamental HVAC R resource material as a senior or graduate level text for a university course in HVAC system design. The manual was written to fill the void between theory and practice to bridge the gap between real world design practices and the theoretical calculations and analytical procedures or on the design of components. This second edition represents an update and revision of the manual. It now features the use of SI units throughout, updated references and the editing of many illustrations. Helps engineers quickly come up with a design solution to a required air conditioning system. Includes issues from comfort to cooling load calculations. New sections on Green HVAC systems deal with hot topic of sustainable buildings.

Congress. House. Committee on Appropriations. Subcommittee on Energy and Water Development, 2009 **Deep Energy Retrofit** Alexander Zhivov, Rüdiger Lohse, 2020-07-13 This book provides detailed information on how to set up Deep Energy Retrofits DERs in public buildings and shares in depth insights into the current status of the major technologies strategies and best practice examples of how to cost effectively combine them Case studies from the U S A and Europe show that that Deep Energy Retrofit can be achieved with a limited core technologies bundle readily available on the market Characteristics of some of these core technology measures depend on the technologies available on an individual nation s market on the minimum requirements of national standards and on economics as determined by a life cycle cost analysis Also requirements to building envelope related technologies e g insulation levels windows vapor and water barriers and requirements for building airtightness depend on specific climate conditions This Guide provides best practice examples of how to apply these technologies in different construction situations High levels of energy use reduction using core technology bundles along with improvements in indoor climate and thermal comfort can be only achieved when a Deep Energy Retrofit adopts a quality assurance process In addition to design construction

commissioning and post occupancy phases of the quality assurance process the Guide emphasizes the importance of clearly and concisely formulating and documenting the Owner's goals, expectations and requirements for the renovated building during development of the statement of work. Another important component of the quality assurance process is a procurement phase during which bidders' qualifications, their understanding of the scope of work and its requirements and their previous experience are analyzed. The building sector holds the potential for tremendous improvements in terms of energy efficiency and reducing carbon emissions and energy retrofits to the existing building stock represent a significant opportunity in the transition to a low carbon future. Moreover, investing in highly efficient building materials and systems can replace long term energy imports, contribute to cost cutting and create a wealth of new jobs. Yet while the technologies needed in order to improve energy efficiency are readily available, significant progress has not yet been made and best practices for implementing building technologies and renewable energy sources are still relegated to small niche applications. Offering essential information on Deep Energy Retrofits, the book offers a valuable asset for architects, public authorities, project developers and engineers alike. *Graphic Standards Field Guide to Commercial Interiors* Corky

Designed by researchers at US National Laboratories to support a new generation of high performance buildings, EnergyPlus and OpenStudio are revolutionizing how building energy modeling is taught in universities and applied by professional architects and engineers around the world. The authors, all researchers at National Renewable Energy Laboratory and members of the OpenStudio software development team, present modeling concepts using open source software that may be generally applied using a variety of software tools commonly used by design professionals. The book also discusses modeling process.

automation in the context of OpenStudio Measures small self contained scripts that can transform energy models and their data to save time and effort They illustrate key concepts through a sophisticated example problem that evolves in complexity throughout the book The text also examines advanced topics including daylighting parametric analysis uncertainty analysis design optimization and model calibration Building Energy Modeling with OpenStudio teaches students to become sophisticated modelers rather than simply proficient software users It supports undergraduate and graduate building energy courses in Architecture and in Mechanical Civil Architectural and Sustainability Engineering
