A business can decide which of the following two **inventory systems** to use to record and control their inventory.

SYSTEM	IMPORTANT POINTS
Perpetual	<ul style="list-style-type: none"> <li>a) Entries are made in a Balance Sheet account called trading stock (an asset account) every time goods are bought and sold.</li> <li>b) Cost of sales needs to be calculated and recorded every time goods are sold.</li> <li>c) When stock is purchased the trading stock account is debited with the cost price (the asset is increasing).</li> <li>d) When stock is sold the trading stock account is credited with the cost price (the asset is decreasing).</li> <li>e) Any additional costs when purchasing stock are debited to the trading stock account (e.g. carriage on purchases).</li> <li>f) This system is better for the internal control of inventory.</li> </ul>
Periodic	<ul style="list-style-type: none"> <li>a) Businesses would decide to use this system when it is not always feasible to calculate cost of sales every time goods are sold.</li> <li>b) Stock purchases are recorded in a nominal account called purchases (an expense account).</li> <li>c) Additional expenses when purchasing stock (e.g. carriage on purchases) are recorded separately in a nominal account called carriage on purchases (an expenses account).</li> <li>d) Cost of sales is therefore only calculated periodically by using the formula:  <math display="block">\text{Opening stock} + \text{purchases} + \text{carriage on purchases} + \text{import duties} + \text{customs duties} - \text{closing stock} = \text{cost of sales}.</math> </li> </ul>

Bartolini Bussi, Xu Hua Sun, 2018-03-29 This twenty third ICMI Study addresses for the first time mathematics teaching and learning in the primary school and pre school setting while also taking international perspectives socio cultural diversity and institutional constraints into account One of the main challenges of designing the first ICMI primary school study of this kind is the complex nature of mathematics at the early level Accordingly a focus area that is central to the discussion was chosen together with a number of related questions The broad area of Whole Number Arithmetic WNA including operations and relations and arithmetic word problems forms the core content of all primary mathematics curricula The study of this core content area is often regarded as foundational for later mathematics learning However the principles and main goals of instruction on the foundational concepts and skills in WNA are far from universally agreed upon and practice varies substantially from country to country As such this study presents a meta level analysis and synthesis of what is currently known about WNA providing a useful base from which to gauge gaps and shortcomings as well as an opportunity to learn from the practices of different countries and contexts

Quantum Structures in Cognitive and Social Science Diederik Aerts, Jan Broekaert, Liane Gabora, Sandro Sozzo, 2016-06-26 Traditional approaches to cognitive psychology correspond with a classical view of logic and probability theory More specifically one typically assumes that cognitive processes of human thought are founded on the Boolean structures of classical logic while the probabilistic aspects of these processes are based on the Kolmogorovian structures of classical probability theory However growing experimental evidence indicates that the models founded on classical structures systematically fail when human decisions are at stake These experimental deviations from classical behavior have been called paradoxes fallacies effects or contradictions depending on the specific situation where they appear But they involve a broad spectrum of cognitive and social science domains ranging from conceptual combination to decision making under uncertainty behavioral economics and linguistics This situation has constituted a serious drawback to the development of various disciplines like cognitive science linguistics artificial intelligence economic modeling and behavioral finance A different approach to cognitive psychology initiated two decades ago has meanwhile matured into a new domain of research called quantum cognition Its main feature is the use of the mathematical formalism of quantum theory as modeling tool for these cognitive situations where traditional classically based approaches fail Quantum cognition has recently attracted the interest of important journals and editing houses academic and funding institutions popular science and media Specifically within a quantum cognition approach one assumes that human decisions do not necessarily obey the rules of Boolean logic and Kolmogorovian probability and can on the contrary be modeled by the quantum mechanical formalism Different concrete quantum theoretic models have meanwhile been developed that successfully represent the cognitive situations that are classically problematical by explaining observed deviations from classicality in terms of genuine quantum effects such as contextuality emergence interference superposition entanglement and indistinguishability In addition the

validity of these quantum models is convincingly confirmed by new experimental tests We also stress that since the use of a quantum theoretic framework is mainly for modeling purposes the identification of quantum structures in cognitive processes does not presuppose without being incompatible with it the existence of microscopic quantum processes in the human brain In this Research Topic we review the major achievements that have been obtained in quantum cognition by providing an accurate picture of the state of the art of this emerging discipline Our overview does not pretend to be either complete or exhaustive But we aim to introduce psychologists and social scientists to this challenging new research area encouraging them at the same time to consider its promising results It is our opinion that if continuous progress in this domain can be realized quantum cognition can constitute an important breakthrough in cognitive psychology and potentially open the way towards a new scientific paradigm in social science

**Fortress Farming** Jeff Neilson, 2025-05-15 Fortress Farming identifies in Indonesia's rural coffee growing regions an

alternative livelihood strategy that is reshaping relationships with land and informing Indonesia's agrarian transition Jeff Neilson presents fortress farming households as ones that are reluctant to embrace productivity maximizing agriculture even as they interact with commodity markets and powerful downstream companies Rather these households tenaciously maintain access to land as a last defense against insecurity in a precarious global economy all the while actively tapping into off farm income sources Fortress farming confounds assumptions that the development process entails an inevitable transition away from the land and into city based manufacturing Shifting away from production to take a fuller view of rural Indonesian coffee growing communities Fortress Farming explores how and why defensive farming strategies have emerged and what these tendencies mean for our understanding of agrarian transition in late industrializing countries in the early twenty first century Neilson posits that late industrializing countries may never undergo a full agrarian transition In the alternative livelihood practice of fortress farming we see a way that local social institutions can resist or at least modify the productive forces of capitalist agriculture

*Mathematical Principles of Human Conceptual Behavior* Ronaldo Vigo, 2014-10-03 The ability to learn concepts lies at the very core of human cognition enabling us to efficiently classify organize identify and store complex information In view of the basic role that concepts play in our everyday physical and mental lives the fields of cognitive science and psychology face three long standing challenges discovering the laws that govern concept learning and categorization behavior in organisms showing how they inform other areas of cognitive research and describing them with the mathematical systematicity and precision found in the physical sciences In light of these theoretical and methodological shortcomings this volume will introduce a set of general mathematical principles for predicting and explaining conceptual behavior The author's theory is based on seven fundamental constructs of universal science invariance complexity information similarity dissimilarity pattern and representation These constructs are joined by a novel mathematical framework that does not depend on probability theory and derives key results from conceptual behavior research with other key areas of cognitive research such as pattern perception similarity assessment and contextual choice The result is a unique and systematic unifying foundation for cognitive science in the tradition of classical physics
