Anatomical and functional neural networks changes in cognitive impairment and healthy aging Fermín Segovia,Cosimo Urgesi,2023-04-14 *Augmentation of Brain Function: Facts, Fiction and Controversy* Mikhail Lebedev,Ioan Opris,Manuel F. Casanova ,2018-09-14 Volume I entitled Augmentation of Brain Functions Brain Machine Interfaces is a collection of articles on neuroprosthetic technologies that utilize brain machine interfaces BMIs BMIs strive to augment the brain by linking neural activity recorded invasively or noninvasively to external devices such as arm prostheses exoskeletons that enable bipedal walking means of communication and technologies that augment attention In addition to many practical applications BMIs provide useful research tools for basic science Several articles cover challenges and controversies in this rapidly developing field such as ways to improve information transfer rate BMIs can be applied to the awake state of the brain and to the sleep state as well BMIs can augment action planning and decision making Importantly BMI operations evoke brain plasticity which can have long lasting effects Advanced neural decoding algorithms that utilize optimal feedback controllers are key to the BMI performance BMI approach can be combined with the other augmentation methods such systems are called hybrid BMIs Overall it appears that BMI will lead to many powerful and practical brain augmenting technologies in the future

Loudness: From Neuroscience to Perception Sabine Meunier,Maaike Van Eeckhoutte,Brian Cecil Joseph Moore,2022-01-07 **Detection and Estimation of Working Memory States and Cognitive Functions Based on Neurophysiological Measures** Felix Putze,Christian Mühl,Fabien Lotte,Stephen Fairclough,Christian Herff,2019-02-05 Executive cognitive functions like working memory determine the success or failure of a wide variety of different cognitive tasks such as problem solving navigation or planning Estimation of constructs like working memory load or memory capacity from neurophysiological or psychophysiological signals would enable adaptive systems to respond to cognitive states experienced by an operator and trigger responses designed to support task performance e g by simplifying the exercises of a tutor system when the subject is overloaded or by shutting down distractions from the mobile phone The determination of cognitive states like working memory load is also useful for automated testing assessment or for usability evaluation While there exists a large body of research work on neural and physiological correlates of cognitive functions like working memory activity fewer publications deal with the application of this research with respect to single trial detection and real time estimation of cognitive functions in complex realistic scenarios Single trial classifiers based on brain activity measurements such as electroencephalography functional near infrared spectroscopy physiological signals or eye tracking have the potential to classify affective or cognitive states based upon short segments of data For this purpose signal processing and machine learning techniques need to be developed and

transferred to real world user interfaces The goal of this Frontiers Research Topic was to advance the State of the Art in signal based modeling of cognitive processes We were especially interested in research towards more complex and realistic study designs for example collecting data in the wild or investigating the interaction between different cognitive processes or signal modalities Bringing together many contributions in one format allowed us to look at the state of convergence or diversity regarding concepts methods and paradigms

Jisu Elsa Jacob, A. Amalin Prince, Omar Farooq, Saadullah Farooq Abbasi, 2025-08-26 Electroencephalography EEG is a versatile tool that has significantly impacted the understanding and treatment of various neurological disorders Due to its non invasive nature and high temporal resolution it allows the monitoring of brain activity in both real time and across extended periods Recent advancements in EEG technology coupled with sophisticated computational algorithms have provided unprecedented insights into the brain s functioning However the full potential of EEG analysis in detecting diagnosing and treating neurological disorders remains underexplored The primary goal of this Research Topic is to highlight and address recent developments in EEG analysis techniques for neurological disorders While traditional methods have been pivotal in understanding neurological disorders leading researchers are innovating advanced EEG analysis techniques leveraging artificial intelligence machine learning and deep learning These technologies are revolutionizing our ability to understand and treat disorders including epilepsy Alzheimer s disease depression encephalopathy and others This Research Topic aims to gather researchers working on advanced EEG analysis techniques to share their knowledge methodologies and applications in a comprehensive manner The ultimate aim is to expedite the evolution of EEG based diagnosis and treatment strategies augmenting the fight against neurological disorders effectively **Closed-Loop Systems for Next-Generation**

Neuroprostheses Timothée Levi, Paolo Bonifazi, Paolo Massobrio, Michela Chiappalone, 2018-04-26 Millions of people worldwide are affected by neurological disorders which disrupt the connections within the brain and between brain and body causing impairments of primary functions and paralysis Such a number is likely to increase in the next years and current assistive technology is yet limited A possible response to such disabilities offered by the neuroscience community is given by Brain Machine Interfaces BMIs and neuroprostheses The latter field of research is highly multidisciplinary since it involves very different and disperse scientific communities making it fundamental to create connections and to join research efforts Indeed the design and development of neuroprosthetic devices span involve different research topics such as interfacing of neural systems at different levels of architectural complexity from in vitro neuronal ensembles to human brain bio artificial interfaces for stimulation e g micro stimulation DBS Deep Brain Stimulation and recording e g EMG Electromyography EEG Electroencephalography LFP Local Field Potential innovative signal processing tools for coding and decoding of neural activity biomimetic artificial Spiking Neural Networks SNN and neural network modeling In order to develop functional communication with the nervous system and to create a new generation of neuroprostheses the study of closed loop systems is mandatory It has been widely recognized that closed loop neuroprosthetic systems achieve more favorable outcomes for users then equivalent open loop devices Improvements in task performance usability and embodiment have all been reported

in systems utilizing some form of feedback The bi directional communication between living neurons and artificial devices is the main final goal of those studies However closed loop systems are still uncommon in the literature mostly due to requirement of multidisciplinary effort Therefore through eBook on closed loop systems for next generation neuroprostheses we encourage an active discussion among neurobiologists electrophysiologists bioengineers computational neuroscientists and neuromorphic engineers This eBook aims to facilitate this process by ordering the 25 contributions of this research in which we highlighted in three different parts A Optimization of different blocks composing the closed loop system B Systems for neuromodulation based on DBS EMG and SNN and C Closed loop BMIs for rehabilitation
