Locating the Epicenter Lab

The epicenter of an earthquake is usually determined by examining seismograms from at least three recording stations. From these records, the distance from the epicenter of the earthquake, to each of the recording stations, can be determined. Circles drawn on a map from each of the seismic stations are then used to locate the epicenter. In addition, the seismic recordings can be used to determine the time at which the earthquake took place, and how powerful the earthquake was at its source.
