Dhakal, Behzad Hassani, Kun Ji, 2024-01-25 As recognized universally by both seismology and earthquake engineering communities the amplitude and frequency content of ground motions are influenced by local site effects including the effects of near surface geologic materials surface topographic and basin effects and so on Strong linkage between seismic site effect and earthquake damage has been commonly demonstrated from many past earthquakes Therefore quantitative and reliable evaluation of the seismic site effect is one of the crucial aspects in seismic hazard assessment and risk mitigation With the significant advancement of modern seismic monitoring networks and arrays huge amounts of high quality seismic records are now being accumulated This encourages us to measure the site responses and its associated uncertainty for selected seismic stations by some record dependent approaches such as horizontal to vertical spectral ratio HVSr measurements generalized spectral inversion GIT methods etc Machine learning techniques also show significant promise in characterization of the near surface geologic properties and prediction of site response These data driven approaches help us to better understand the physics of spatial and temporal variabilities of ground motions Due to more and more site specific data being captured invoking non ergodic assumptions in seismic response analysis has recently been a topic of great interest in the community For specific site response analysis numerical simulations are carried out to model the dynamic process of seismic waves propagating and scattering in the subsurface strata With development of modeling capacity great efforts have been taken to evaluate

quantitatively the complex 2D and 3D effects on seismic site response      *Earthquake Disaster Simulation of Civil Infrastructures* Xinzheng Lu, Hong Guan, 2021-02-01 The first edition of this monograph presenting accurate and efficient simulations of seismic damage to buildings and cities has received significant attention from the research community To keep abreast of the rapid development in recent years our latest breakthrough achievements have been added to this new edition including novel resilient structural components secondary disaster simulations emergency responses and resilient recovery of communities after earthquake This edition comprehensively covers a range of numerical modeling approaches higher performance computation methods and high fidelity visualization techniques for earthquake disaster simulation of tall buildings and urban areas It also demonstrates successful engineering applications of the proposed methodologies to typical landmark projects e g Shanghai Tower and CITIC Tower two of the world's tallest buildings Beijing CBD and San Francisco Bay Area Reported in this edition are a collection of about 60 high impact journal publications which have already received high citations      **Soil-structure interaction in seismic analysis** Alexander Tyapin, 2019-06-11 Soil structure interaction SSI is an important phenomenon in the seismic response analysis As seismologists describe seismic excitation in terms of the seismic motion of certain control point at the free surface of the initial site the question is whether the same point of the structure after structure appears will have the same seismic response motion in case of the same seismic event If yes then seismic motion from seismologists is directly applied to the base of the structure it is called fixed base analysis and they say that no SSI occurs though literally speaking soil is forcing structure to move so interaction is always present This is a conventional approach in the field of civil engineering However if heavy and rigid structure sometimes embedded is erected on medium or soft soil site this structure changes the seismic response motion of the soil as compared to the initial free field picture Such a situation is typical for Nuclear Power Plants NPPs deeply embedded structures etc The book describes different approaches to SSI analysis and different SSI effects Special attention is paid to the Combined Asymptotic Method CAM developed by the author and used for the design of NPPs in seismic regions Nowadays some civil structures have parameters comparable to those of NPPs e g masses and embedment so these approaches become useful for the civil structural engineers as well Paperback <https://amzn.to/38B4zsE>      **Ultra-low-Cycle Fatigue Failure of Metal Structures under Strong Earthquakes** Liang-Jiu Jia, Hanbin Ge, 2018-11-02 This book presents experimental results and theoretical advances in the field of ultra low cycle fatigue failure of metal structures under strong earthquakes where the dominant failure mechanism is ductile fracture Studies on ultra low cycle fatigue failure of metal materials and structures have caught the interest of engineers and researchers from various disciplines such as material civil and mechanical engineering Pursuing a holistic approach the book establishes a fundamental framework for this topic while also highlighting the importance of theoretical analysis and experimental results in the fracture evaluation of metal structures under seismic loading Accordingly it offers a valuable resource for undergraduate and graduate students interested in ultra low cycle
