Considerations Many techniques described here involve a number of hazards such as high electrical current and voltage radioactivity and highly toxic chemicals It is absolutely essential that the instructions of equipment manufacturers be followed and that particular attention be paid to the local and federal safety regulations

B Introduction The expression of prokaryotic and eukaryotic genes has been shown most often to be regulated at the level of mRNA synthesis Thanks to the rapid development of methods for dissecting DNA sequences cis acting regulatory elements such as promoters and enhancers have been recognised More recently the widely expressed intuition that discrete sequences within these elements constitute binding sites for sequence specific binding proteins has been confirmed especially through the use of footprinting assays for examples Galas and Schmitz 1978 This and similar assays have already resulted in the recognition isolation and analysis of DNA binding proteins for several genes Excellent reviews exist of the structural studies on these transcription regulatory proteins and related DNA elements for example Glover 1989 and Johnson and McKnight 1989 to which the reader is referred for detailed information To set the scene for applications of the techniques described in this volume only the barest outline of previous studies is presented here Protein DNA interactions are dependent on very specific tertiary configurations of the binding protein which allow the closest contact with the DNA helix
