Yield Stability and Quality in Vegetable Crops Marios Kyriacou, Giuseppe Colla, Youssef Roupheal, 2021-03-29 Vegetable growers around the world only collect on average half of the yield they would obtain under optimal conditions known as yield potential It is estimated that 60 70% of the yield gap is attributable to abiotic factors such as salinity drought suboptimal temperatures nutritional deficiencies flooding waterlogging heavy metals contamination adverse soil pH and organic pollutants while the remaining 30 40% is due to biotic factors especially soilborne pathogens foliar pathogens arthropods and

weeds Under climate change forecasts the pressure of biotic abiotic stressors on yield is expected to rise and challenge further global food security To meet global demand several solutions have been proposed focusing on the breeding of varieties with greater yield potential but this one size fits all solution leads to limited benefits In order to overcome the current situation grafting of elite scion varieties onto vigorous rootstock varieties has been suggested as one of the most promising drives towards further yield stability Specifically the implementation of suitable rootstock scion environment combinations in Solanaceous tomato eggplant pepper and Cucurbitaceous melon watermelon melon high value crops represents an untapped opportunity to secure yield stability and reliability under biotic abiotic stresses This Special Issue invites Original Research Technology Reports Methods Opinions Perspectives Invited Reviews and Mini Reviews dissecting grafting as a sustainable agro technology for enhancing tolerance to abiotic stresses and reducing disease damage In addition the following are of interest potential contributions dealing with genetic resources for rootstock breeding practices and technologies of rootstock breeding and rootstock scion signaling as well as the physiological and molecular mechanisms underlying graft compatibility In addition the effect of grafting on vegetable quality practical applications and nursery management of grafted seedlings and specialty crops e g artichoke and bean will be considered within the general scope of the Special Issue We highly believe that this compilation of high standard scientific papers on the principles and practices of vegetable grafting will foster discussions within this important field

Micropropagation P. Debergh, Richard H.

Zimmerman, 2012-12-06 Micropropagation is a technology that has developed within the past 30 years Earlier overviews of plant tissue culture have reviewed micropropagation as just one of many tissue culture procedures in use Since the applications of this technology have multiplied so rapidly in recent years we decided that a specific overview of the technology was now appropriate Our book begins with a review of the general principles of tissue culture as applied to micropropagation This review is concise since the general topic has been covered in numerous other books and reviews The basic principles of laboratory design and construction are summarized in the second chapter Common problems encountered in micropropagation both during and after culture are examined in detail in four chapters As micropropagation developed from a laboratory curiosity to a commercial industry different considerations became important These are discussed in two chapters An attempt has been made to assess the current status of commercial production around the world This has been difficult because commercial production figures are often closely guarded and little has been done to collect statistics on this growing industry Applications to a broad range of crops are discussed in a series of chapters These try to report the state of the art in each area but since applications for some crops are much more advanced than for others the focus of these chapters varies depending upon the progress that has been made
