Essentials of Tissue and Cells Banking George Galea, Marc Turner, Sharon

Zahra,2021-07-02 It has been 10 years since the first edition of Essentials of Tissue Banking has been published There is still relatively little published on the technical and scientific principles on routine tissue and cell banking based on scientific principles The 1st edition was very successful and after a 10 year gap there is a need of an update and an expansion of the book s remit The format of the book follows that of the previous edition split into 5 sections Management of donors and the banking of common tissues and cells Principles of storage and processing of tissues and cells Ensuring the safety of the products by testing the donor the tissues and the environment supported by a quality system and an IT infrastructure all working within the constraints of current regulatory and ethical environments This edition however provides a significant update Many the chapters have been completely rewritten by different experts Like the 1st edition they were given a free hand in the way they wrote their chapter with a guideline that they had to be concise clear and up to date The authors were also asked to provide the scientific and technical basis that provides the rationale of the processes they describe Also the scope of the book has been somewhat extended In view of the fact that many cellular therapies are now routinely practiced 2 new chapters have been added one on the banking of haematopoietic stem cells and one on human embryonic stem cells They have been deliberately chosen to illustrate the extreme spectrum of cellular therapies from one of the simplest to one of the most complex The intention of the book has remained the same to cover and update banking of current practices in essential tissue and cell banking It is therefore hoped that by keeping the book as concise and up to date as possible it will find a place on the shelves of many tissue establishments

Understanding the Materno-Fetal Interface During Microbial Infections Demba Sarr,Ricardo E. Fretes,Ulrike Kemmerling,Sodiomon B. Sirima,2020-12-11

Pregnancy is a physiologically and immunologically challenging health state Immunological and physiological changes throughout the course of pregnancy make pregnant women usually susceptible to infection with microbial agents Infections with pathogens during pregnancy can have devastating consequences to both the fetus and his her mother These infections are linked with adverse pregnancy outcomes Infections with parasites viruses or bacteria can be associated with maternal anemia abortion intrauterine growth retardation preterm delivery fetal morbidity and high risk of mortality during the first years of life Despite these significant consequences and complications associated with infections by microbial pathogens during the course of gestation very little is known about the underlying mechanisms of the pathogenesis and immunopathology of infections during pregnancy The Research Topic proposed here in will focus on microbial infections during pregnancy Studies and review papers addressing the pregnant host fetus pathogen interactions the host fetus immunological response against infections during gestation trans placental transfer of infections during pregnancy are welcome Topics related to model systems used to mirror the biology in human the pathogenesis and molecular pathways as well as the mechanisms of the disease at the maternofetal interface including the placenta the amniotic fluid and the fetal membranes will be considered making the scope and interest of the topic relatively broad There is a growing number of pathogens associated with pregnancy In most cases women are more susceptible to infections with these pathogens when they become pregnant in comparison to their non pregnant counterparts Unfortunately vertical transmission occurs in most cases but the underlying mechanisms are still unknown The placenta has always been considered as a barrier against congenital infections but studies have indicated that microbial pathogens breach this barrier The amniotic fluid and the fetal membranes are also important components of vertical transmission because of their non sterile state even in most healthy pregnancies During pregnancy infections by malaria or toxoplasmosis as well as other viral or bacterial pathogens lead to an uncontrolled inflammatory response recognized as a significant cause for preterm delivery and intra uterine growth retardation leading to low birth weight a risk factor to infant morbidity and mortality To successfully prevent treat eradicate or educate about microbial infections during pregnancy we must understand the molecular mechanisms by which they cause poor birth outcomes including how vertical transmission occurs at the maternofetal interface
