**Background:** The AABB (formerly, the American Association of Blood Banks) developed this guideline on appropriate use of platelet transfusion in adult patients.

**Methods:** These guidelines are based on a systematic review of endorized, clinical trials and observational studies (1900 to September 2014) that reported clinical outcomes on patients receiving prophylactic or therapeutic platelet transfusions. An expert panel reviewed the data and developed recommendations using the Grading of Recommendations Assessment, Development and Evaluation (GRADE) framework.

**Recommendation 1:** The AABB recommends that platelets should be transfused prophylactically to reduce the risk for spontaneous bleeding in hospitalized adult patients with therapy-induced hypoproliferative thrombocytopenia. The AABB recommends transfusing hospitalized adult patients with a platelet count of  $10 \times 10^9$  cells/L or less to reduce the risk for spontaneous bleeding. The AABB recommends transfusing up to a single apheresis unit or equivalent. Greater doses are not more effective, and lower doses equal to one half of a standard apheresis unit are equally effective. (Grade: strong recommendation; moderate-quality evidence)

**Recommendation 2:** The AABB suggests prophylactic platelet transfusion for patients having elective central venous catheter placement with a platelet count less than  $20 \times 10^9$  cells/L. (Grade: weak recommendation; low-quality evidence)

**Recommendation 3:** The AABB suggests prophylactic platelet transfusion for patients having elective diagnostic lumbar puncture with a platelet count less than  $50 \times 10^9$  cells/L. (Grade: weak recommendation; very-low-quality evidence)

**Recommendation 4:** The AABB suggests prophylactic platelet transfusion for patients having major elective nonneurological surgery with a platelet count less than  $50 \times 10^9$  cells/L. (Grade: weak recommendation; very-low-quality evidence)

**Recommendation 5:** The AABB recommends against routine prophylactic platelet transfusion for patients who are nonthrombocytopenic and have cardiac surgery with cardiopulmonary bypass. The AABB suggests platelet transfusion for patients having bypass who exhibit perioperative bleeding with thrombocytopenia and/or evidence of platelet dysfunction. (Grade: weak recommendation; very-low-quality evidence)

**Recommendation 6:** The AABB cannot recommend for or against platelet transfusion for patients receiving antiplatelet therapy who have intracranial hemorrhage (traumatic or spontaneous). (Grade: uncertain recommendation; very-low-quality evidence)

Approximately 2.2 million platelet doses are transfused annually in the United States (1). A high proportion of these platelet units are transfused prophylactically to reduce the risk for spontaneous bleeding in patients who are thrombocytopenic after chemotherapy or hematopoietic progenitor cell transplantation (HPCT) (1-3). Unlike other blood components, platelets must be stored at room temperature, limiting the shelf life of platelet units to only 5 days because of the risk for bacterial growth during storage. Therefore, maintaining hospital platelet inventories is logistically difficult and highly resource-intensive (4, 5). Platelet transfusion is associated with several risks to the recipient (Table 1), including allergic reactions and febrile non-hemolytic reactions. Sepsis from a bacterially contaminated platelet unit represents the most frequent infectious complication from any blood product today (8). In any situation where platelet transfusion is being considered, these risks must be balanced against the potential clinical benefits.

## GUIDELINE FOCUS

These guidelines were designed to provide pragmatic recommendations, based on the best available

published evidence, about when platelet transfusion may be appropriate in adult patients. For several common clinical situations, we attempted to identify a platelet count threshold below which platelet transfusion may improve hemostasis and above which platelet transfusion is unlikely to benefit the patient. We did not attempt to address all clinical situations in which platelets may be transfused, and these guidelines are not intended to serve as standards. Clinical judgment, and not a specific platelet count threshold, is paramount in deciding whether to transfuse platelets.

## TARGET POPULATION

These guidelines provide advice for adult patients who are candidates for platelet transfusion.

## GUIDELINE DEVELOPMENT PROCESS

The AABB commissioned and funded the development of these guidelines.

### Panel Composition

A panel of 21 experts was convened. Fifteen participants were members of the Clinical Transfusion Medicine Committee of the AABB, all of whom were

Juffermans, Timothy S. Walsh, 2014-09-30 Due to a high incidence of anemia critically ill patients are frequently transfused with up to 40% of patients receiving a transfusion during their stay in the Intensive Care Unit It has become increasingly clear that there is an association between transfusion and adverse outcomes underlining the need for a careful assessment of the risks and benefits of a blood transfusion In the last decade there have been several large clinical trials that have studied red blood cell transfusion triggers in various ICU patient populations allowing us to take a

personalized approach to transfusion Moreover ICU patients often suffer from coagulopathy Recent studies have addressed the effectiveness of fresh frozen plasma and platelets to prevent or treat bleeding Aiming at a personalized therapy approach in transfusion practice this book is the first to offer a comprehensive summary of transfusion triggers for red blood cells in specific ICU patient populations and specific conditions In addition it discusses evidence for triggers for plasma and platelets and outlines the most common adverse effects of transfusion in the ICU Transfusion in the Intensive Care Unit is a practical handbook that can be used in everyday practice to guide transfusion and thus will serve as a valuable resource for physicians fellows and residents working in Intensive Care Anesthesiology and Cardiac Surgery Medical Management of the Surgical Patient Michael F.
