Lunar and Interplanetary Trajectories Robin Biesbroek, 2015-12-23 This book provides readers with a clear description of the types of lunar and interplanetary trajectories and how they influence satellite system design. The description follows an engineering rather than a mathematical approach and includes many examples of lunar trajectories based on real missions. It helps readers gain an understanding of the driving subsystems of interplanetary and lunar satellites. The tables and graphs showing features of trajectories make the book easy to understand.

Space Flight Dynamics Craig A. Kluever, 2018-05-29 Thorough coverage of space flight topics with self-contained chapters serving a variety of courses in orbital mechanics, spacecraft dynamics, and astronautics. This concise yet comprehensive book on space flight dynamics addresses all phases of a space mission: getting to space, launch, trajectories, satellite motion in space, orbital motion, orbit transfers, attitude dynamics, and returning from space, entry, flight mechanics. It focuses on orbital mechanics with emphasis on two-body motion, orbit determination, and orbital maneuvers with applications in Earth-centered missions and interplanetary missions. Space Flight Dynamics presents wide-ranging information on a host of topics not always covered in competing books. It discusses relative motion, entry, flight mechanics, low-thrust transfers, rocket propulsion fundamentals, attitude dynamics, and attitude control. The book is filled with illustrated concepts and real-world examples drawn from the space industry. Additionally, the book includes a computational toolbox composed of MATLAB M-files for performing space mission analysis. Key features: Provides practical real-world examples illustrating key concepts throughout the book. Accompanied by a website containing MATLAB M-files for conducting space mission analysis. The Development of Propulsion Technology for U.S. Space-Launch Vehicles, 1926-1991 J. D. Hunley, 2013-03-15 In this definitive study, J. D. Hunley traces the program's development from Goddard's early rockets and the German V-2 missile through the Titan IVA and the Space Shuttle, with a focus on space launch vehicles. Since these rockets often evolved from early missiles, he pays considerable attention to missile technology not as an end in itself but as a contributor to launch vehicle technology. Focusing especially on the engineering culture of the program, Hunley communicates this very human side of technological development by means of anecdotes, character sketches, and case studies of problems faced by rocket engineers. He shows how such a highly adaptive approach enabled the evolution of a hugely complicated technology that was impressive but decidedly not rocket science. Unique in its single-volume coverage of the evolution of launch vehicle technology from 1926 to 1991, this meticulously researched work will inform scholars and engineers interested in the history of technology and innovation as well as those specializing in the history of space flight.
