

Ch. 54: Ecosystems Review Guide Answer Key

1. An ecosystem is the living (biotic) and nonliving (abiotic) parts that interact in an area.
2. All energy comes from the sun. Light energy is converted to chemical through photosynthesis and passed through the ecosystems as organisms eat each other (food web). Energy is lost in the form of heat.
3. Energy flows through an ecosystem and matter cycles.
4. Both energy and matter can be neither created nor destroyed.
5. Primary Producers (or Autotrophs)
6. Plants, some protists, some bacteria
7. Archaea
8. Trophic levels are the different levels of food/energy production and consumption: producer, primary consumer (herbivore), secondary consumer (omnivore or carnivore), etc. The first trophic level is always primary producers.
9. Detritivores are organisms that consume detritus (dead things, feces, etc) and recycle nutrients to the soil/water. Examples include earthworms, fungi, some bacteria, and slugs.
10. Cow: primary consumer/herbivore, grass: producer, human: secondary consumer (omnivore), mushroom: detritivore (decomposer)
11. Primary production is the amount of light energy converted to chemical energy by autotrophs during a given time period for a given area. Gross primary production is the total energy conversion; net primary production is the total minus the energy used for respiration by the primary producers (remember plants have mitochondria too!).
12. $NPP = GPP - R$
13. Ecologists measure net primary production to calculate the amount of growth in an ecosystems. If the net production is positive, the ecosystem is healthy and growing. If it is negative, the ecosystem is unbalanced and declining.
14. A tropical forest would have more biomass per unit area because it has a higher density of living organisms than a desert.
15. We can measure the change in the ratio of CO₂ to O₂ gas dissolved in the water in a closed system. Sorry, we won't actually be doing this lab in class.
16. Primary productivity in aquatic ecosystems is limited by sunlight availability (murkiness of the water) and by limited nutrients available in the water or sand.
17. A limiting nutrient is the nutrient in shortest supply relative to what the plants need to grow. For example there may be plenty of nitrogen but not enough phosphorous for plants to keep growing. In that case phosphorous is the limiting nutrient. Off of Long Island, the limiting nutrient is nitrogen. In the Sargasso Sea, the limiting nutrient is iron.
18. Common sources of nitrates and phosphates are fertilizers added to farms.
19. Eutrophication is the process in which nutrients are added to a nutrient-poor body of water, therefore greatly increasing primary production. The main factor contributing to eutrophication is nutrient availability, but sunlight and temperature also play a part.
