Fretting Wear, Fretting Fatigue and Damping of Structures Toshio Hattori, 2023-12-26 This book provides a comprehensive overview of the mechanical distinctions between

fretting damage under axial or bending external forces and fretting damage under a torsional load It emphasizes the importance of studying practical accident cases to efficiently acquire technical skills The book is structured around the fundamental technologies of material science tribology and mechanics which are vital for understanding and addressing technical issues The author has incorporated all fretting countermeasure technologies which were previously often sensory and empirical in nature and repositioned them as technologies grounded in fundamental principles The book proposes an economical approach to product operation that maintains reliability by integrating not only design technology but also maintenance practices It delves into specific materials such as titanium alloys and aluminum alloys which have seen increased use for weight reduction in industries like aerospace In this book Critical Distance Stress Theory that can easily derive the fatigue limit and fatigue life of the stress singular field at the contact edge was presented As a result the fretting fatigue strength and life can be predicted from the same FEM stress analysis as the normal stress concentration part And finally introducing a novel fretting mechanical model the book focuses on scenarios where pressure force N and repeated tangential force F are applied to two planar objects with the tangential force being transmitted solely through friction at the contact surface This model finds relevance in turbine blade connection structures among other applications The author references Asai's research example which encompasses fretting mechanical analysis fretting wear evaluation fatigue assessment and structural damping evaluation using this model

AIR CRASH INVESTIGATIONS EYE OF THE NEEDLE The Crash of British Airways Flight 38 Hans Griffioen, editor, 2012-11-01 On 28 November 2008 a Boeing 777 200ER operated by British Airways as flight BA38 on its way from Beijing China to London Heathrow suffered on approach to Heathrow Airport an in flight engine rollback At 720 feet agl the right engine ceased responding to autothrottle commands for increased power and instead the power reduced to 1.03 Engine Pressure Ratio (EPR) Seven seconds later the left engine power reduced to 1.02 EPR This reduction led to a loss of airspeed and the aircraft touching down some 330 m short of the paved surface of Runway 27L at London Heathrow The investigation identified that the reduction in thrust was due to restricted fuel flow to both engines It was determined that the restriction

occurred most probably in the Fuel Oil Heat Exchangers The investigation identified the forming of ice in the fuel system as probable cause The aircraft was destroyed but there were no casualties Repair of Composite Laminates Stanford University.
