Bonded Repair of Aircraft Structures A. Baker, Jones, 2012-12-06 The conventional approach to through life support for aircraft structures can be divided into the following phases i detection of defects ii diagnosis of their nature and significance iii forecasting future behaviour prognosis and iv pre scription and implementation of remedial measures including repairs Considerable scientific effort has been devoted to developing the science and technology base for the first three phases Of particular note is the development of fracture mechanics as a major analytical tool for metals for predicting residual strength in the presence of cracks damage tolerance and rate of crack propagation under service loading Intensive effort is currently being devoted to developing similar approaches for fibre composite structures particularly to assess damage tolerance and durability in the presence of delamination damage Until recently there has been no major attempt to develop a science and tech nology base for the last phase particularly with respect to the development of repairs Approaches are required which will allow assessment of the type and magnitude of defects amenable to repair and the influence of the repair on the stress intensity factor or some related parameter Approaches are also required for the development and design of optimum repairs and for assessment of their durability

Progress in Durability Analysis of Composite Systems K.L. Reifsnider, 1998-01-01 Composite material systems are the basis for much of the natural world around us and are rapidly becoming the basis for many modern engineering components A controlling feature for the general use of such systems is their damage tolerance durability and reliability The present book is a comprehensive cross section of the state of the art in the field of the durability of polymer based composite and adhesive systems As such it is of special value to researchers concerned with the frontier of the field to students concerned with the substance of the subject and to the applied community concerned with the finding methodologies that make it possible to design safe and durable engineering components using material systems

**Rehabilitation of Metallic Civil Infrastructure Using Fiber Reinforced Polymer (FRP) Composites** Vistas M. Karbhari, 2014-03-14 Fiber reinforced polymer FRP composites are becoming increasingly popular as a material for rehabilitating aging and damaged structures. *Rehabilitation of Metallic Civil Infrastructure Using Fiber Reinforced Polymer FRP Composites* explores the use of fiber reinforced composites for enhancing the stability and extending the life of metallic infrastructure such as bridges. Part I provides an overview of materials and repair encompassing topics of joining steel to FRP composites finite element modeling and durability issues. Part II discusses the use of FRP composites to repair steel components focusing on thin walled hollow steel sections steel tension members and cracked aluminum components. Building on Part II the third part of the book reviews the fatigue life of strengthened components. Finally Part IV covers the use of FRP composites to rehabilitate different types of metallic infrastructure with chapters on bridges historical metallic structures and other types of metallic infrastructure. *Rehabilitation of Metallic Civil Infrastructure Using Fiber Reinforced Polymer FRP Composites* represents a standard reference for engineers and designers in infrastructure and fiber reinforced polymer areas and manufacturers in the infrastructure industry as well as academics and researchers in the field. Steven Johnson,1998 The increased numbers of bonded composite components and bonded repairs of cracked structures make knowledge of adhesive bonding crucial to aircraft design and life extension This report covers an effort which focused on using fracture mechanics to evaluate the Mode I fracture and fatigue properties of several adhesively bonded aerospace material systems The research concentrated on bond line cracking rather than fatigue crack growth in composite or metal adherends Particular attention was paid to the environmental durability of bonded systems in use or intended for use on transport fighter and supersonic aircraft Analysis was performed using closed form solutions as well as finite element analyses Results were discussed with respect to their relevance and applicability to bonded joint design Key results include the identification of significant degradation in some varieties of bonded joints subjected to long term isothermal exposure under hot wet conditions The degradation was manifested by decreased fracture toughness and fatigue threshold levels Finite element analyses were performed on specimens with dissimilar adherends having complex geometries and thermally induced stresses in the bond line A case study in which finite element analyses were used to relate the experimental results from this program with those of an independent project is also included The analyses highlight the importance of using tapered adherends to avoid fatigue failures and show that typical aircraft skin stresses are below experimentally obtained threshold values for the specimen geometries investigated Results of this study emphasize that the environmental durability of adhesively bonded joints is a key issue which must be considered by aerospace design engineers
