

An object's orbit depends on the "mass inside" its orbit (also known as the *interior mass*). For a planet in our Solar System, you can find the interior mass by adding the Sun's mass to the mass of each object between the Sun and the planet's orbit. For example, the interior mass to Earth's orbit would be the Sun's mass plus the mass of Mercury plus the mass of Venus.

Here is a table that lists each planet, the mass inside each planet's orbit, and the speed at which the planets orbit the Sun.

| Planet | Interior Mass (solar masses) | Orbital Speed (km/s) |
|---------|------------------------------|----------------------|
| Mercury | 1.00 | 47.9 |
| Venus | 1.0000027 | 35.0 |
| Earth | 1.0000057 | 29.8 |
| Mars | 1.0000060 | 24.1 |
| Jupiter | 1.00096 | 13.1 |
| Saturn | 1.0012 | 9.66 |
| Uranus | 1.0013 | 6.81 |
| Neptune | 1.0013 | 5.43 |

1) Where is the vast majority of mass in the solar system located? What object or objects account for most of this mass?

2) Two students are discussing their answers to Question 1:

Student 1: *I think the majority of the mass in the solar system must include both the Sun and the planets. As you get farther away from the Sun, the interior mass gets bigger and bigger because you include more planets.*

Student 2: *I disagree. The majority of the mass in the solar system is from just the Sun by itself. Sure the mass gets a little bigger as you include more planets, but the additional mass from planets is really small.*

Do you agree or disagree with either or both of the students? Explain your reasoning.

3) How do the orbital speeds of planets farther from the Sun compare to the orbital speeds of planets closer to the Sun?

see in the universe It is called Black Matter It is produced when all of the space is compressed out of Ordinary Matter by extreme gravity If there is enough Ordinary Matter to start with the Black Matter will form a solid sphere called a Black Marble Black Marbles form the center of Black Holes From this basic idea the theory follows logical steps that provide clear and plausible explanations of the most profound mysteries that confront Physics today It explains the structure of the Black Hole the formation of galaxies and the Big Bang itself The theory also provides a surprisingly simple explanation of the source and fuel of the Dark Energy that propels the expansion of the universe In an hour of easy reading it will become clear Why our universe is just what it appears to be

Dark Matter and Dark Energy Sabino Matarrese, Monica Colpi, Vittorio Gorini, Ugo Moschella, 2011-02-10 This book brings together reviews from leading international authorities on the developments in the study of dark matter and dark energy as seen from both their cosmological and particle physics side Studying the physical and astrophysical properties of the dark components of our Universe is a crucial step towards the ultimate goal of unveiling their nature The work developed from a doctoral school sponsored by the Italian Society of General Relativity and Gravitation The book starts with a concise introduction to the standard cosmological model as well as with a presentation of the theory of linear perturbations around a homogeneous and isotropic background It covers the particle physics and cosmological aspects of dark matter and dynamical dark energy including a discussion of how modified theories of gravity could provide a possible candidate for dark energy A detailed presentation is also given of the possible ways of testing the theory in terms of cosmic microwave background galaxy redshift surveys and weak gravitational lensing observations Included is a chapter reviewing extensively the direct and indirect methods of detection of the hypothetical dark matter particles Also included is a self contained introduction to the techniques and most important results of numerical e g N body simulations in cosmology This volume will be useful to researchers PhD and graduate students in Astrophysics Cosmology Physics and Mathematics who are interested in cosmology dark matter and dark energy

Dark Matter in the Universe John N. Bahcall, Tsvi Piran, Steven Weinberg, 2004 If standard gravitational theory is correct then most of the matter in the universe is in an unidentified form which does not emit enough light to have been detected by current instrumentation This book is the second edition of the lectures given at the 4th Jerusalem Winter School for Theoretical Physics with new material added The lectures are devoted to the missing matter problem in the universe the search to understand dark matter The goal of this volume is to make current research work on unseen matter accessible to students without prior experience in this area and to provide insights for experts in related research fields Due to the pedagogical nature of the original lectures and the intense discussions between the lecturers and the students the written lectures included in this volume often contain techniques and explanations not found in more formal journal publications

Yet Another Introduction to Dark Matter Martin Bauer,Tilman Plehn,2019-06-11 Dark matter is a frequently discussed topic in contemporary particle physics Written strictly in the language of particle physics and quantum field theory these course based lecture notes focus on a set of standard calculations that students need in order to understand weakly interacting dark matter candidates After introducing some general features of these dark matter agents and their main competitors the Higgs portal scalar and supersymmetric neutralinos are introduced as our default models In turn this serves as a basis for exploring four experimental aspects the dark matter relic density extracted from the cosmic microwave background indirect detection including the Fermi galactic center excess direct detection and collider searches Alternative approaches like an effective theory of dark matter and simplified models naturally follow from the discussions of these four experimental directions
