

### Metabolism

1. Explain the role of catabolic and anabolic pathways in cellular metabolism.
  - Catabolic pathways break down macromolecules into forms to be used in our body by breaking the bonds between the monomers of those macromolecules, releasing energy.
  - Anabolic pathways use those broken down molecules produced by catabolism to rearrange them into usable forms for the body by using kinetic energy to form new chemical bonds between the monomers.
2. Explain the first and second laws of thermodynamics in your own words.
  - 1st law - energy cannot be created nor destroyed, only transformed
  - 2nd law - energy transformation increases the entropy of universe
3. Explain why highly ordered living organisms do not violate the second law of thermodynamics.
  - Even though cells create organized structures by taking in less organized starting materials, the organisms eat, so the catabolic reactions turn complex molecules into simpler ones. As they use that energy, they release by products such as CO<sub>2</sub> and H<sub>2</sub>O, which in turn increases energy.
4. Describe the function of enzymes in biological systems.
  - Enzymes decrease the activation energy for a chemical reaction to occur, allowing chemical reactions to occur more quickly in biological systems.
5. Explain how enzyme structure determines enzyme specificity.
  - Enzymes are proteins. The folding and arrangement of protein R groups determine the structure and function of proteins, therefore influencing the structure and function of enzyme specificity.
6. Explain the induced-fit model of enzyme function.
  - Active site - where the substrate binds to the enzyme
  - Induced fit allows enzymes to change the shape of their active site to allow the substrate to bind better by bringing chemical groups of the active site into positions that enhance their ability to catalyze the chemical reaction.
7. Describe the mechanisms by which enzymes lower activation energy.
  - Enzymes catalyze reactions by lowering the activation energy to allow reactants to absorb enough energy to reach the transition state at normal conditions.
8. Explain how substrate concentration affects the rate of an enzyme-catalyzed reaction.
  - With a higher substrate concentration, more products are formed through enzyme-catalyzed reactions.
9. Explain how temperature, pH, cofactors, and enzyme inhibitors can affect enzyme activity.
  - Enzyme activity typically increases with the temperature until it reaches optimal temperature. After it reaches optimal temperature, it begins to denature.
  - Same with pH - the optimal pH increases enzyme activity, but a pH that is too low or too high will cause the enzyme to denature.
  - Competitive inhibitors reduce enzyme activity by blocking the active site
