

## 7.1 Structure of Transport Tissues:

Angiosperms are the flowering plants which are at the furthest point of the evolution spectrum.

Monocotyledons:

- One seeded leaves which are long and narrow and have veins running parallel to the length of the leaf.
- The flowering parts are always grouped in 3's with no leaf stalk e.g. grasses, lilies and palms.

Dicotyledons:

- Two seeded leaves with broad leaves which have branched leaf veins sprouting from the central line.
- The flowering part is grouped in 4's or 5's e.g. beans, shrubs etc.

Cell types in plant tissues:

- Xylem (vessel and tracheid) - dead and lignified structure which transports water and minerals from the roots to the leaves.
- Phloem sieve element - Alive structure which transports sugars, aa and hormones round the plant, from source to sink.
- Phloem companion cells - provide metabolic support to the sieve tubes, by moving substances in and out.
- Parenchyma - storage of foods like starch and when turgid they support the plant from Wilting - they are generalised cells and also transport water and minerals through the walls, as well as gas exchange between the cells.
- Sclerenchyma - dead and lignified cells which support in areas of non-active growth e.g. lignin and cellulose in cell walls.
- Collenchyma - modified form of parenchyma with extra cellulose in corners of the cell - provide strength and support in areas of active growth.
- Meristem - stem cell tissue

Root:

- The cross section of a root shows the presence of a single, central vascular bundle

- The endodermis controls the entry of solutes into the cell and prevents pathogen entry - water moves by symplast pathway.
- Stem:
- The cross section of a stem shows several vascular bundles arranged in characteristic patterns.
- The xylem is stained red and found on the central side of the cambium wall.

- Can be differentiated to the other plant cross sections due to...
  - Fibre cap of Lignified sclerenchyma above the xylem vessels, creating red section.
  - Ring of cambium moving through every vascular bundle - they contain meristem tissue which can divide to make the ring larger and provide space for more vascular bundles to grow.
  - Multiple vascular bundles in a ring-like structure.
