Steele, 2012-12-06 From the preface by Joel E Cohen A century from now humanity will live in a managed or mismanaged global garden We are debating the need to preserve tropical forests Farming of the sea is providing an increasing part of our fish supply We are beginning to control atmospheric emissions In 100 years we shall use novel farming practices and genetic engineering of bacteria to manipulate the methane production of rice fields The continental shelf will be providing food energy possibly even living space To make such intensive management possible will require massive improvements in data collection and analysis and especially in our concepts A century hence we will live on a wired earth the oceans and the crust of the earth will receive the same comprehensive monitoring now devoted to weather As the peoples of currently developing countries increase their levels of wealth the need for global management will become irresistible as impatience with the accidents of nature and intolerance of mismanagement of the environment especially of living resources grow Our control of physical perturbations and chemical

inputs to the environment will be judged by the consequences to living organisms and biological communities How can we obtain the factual and theoretical foundation needed to move from our present fragmented knowledge and limited abilities to a managed global garden This problem was addressed in the lectures and workshops of a summer school on patch dynamics at Cornell University The school emphasized the analysis and interpretation of spatial patterns in terrestrial and marine environments This book contains the course material of this school combining general reviews with specific applications

Models in Biology is an introductory book for readers interested in biological applications of mathematics and modeling in biology. A favorite in the mathematical biology community, it shows how relatively simple mathematics can be applied to a variety of models to draw interesting conclusions. Connections are made between diverse biological examples linked by common mathematical themes. A variety of discrete and continuous ordinary and partial differential equation models are explored. Although great advances have taken place in many of the topics covered, the simple lessons contained in this book are still important and informative. Audience: the book does not assume too much background knowledge, essentially some calculus and high school algebra. It was originally written with third and fourth year undergraduate mathematical biology majors in mind, however, it was picked up by beginning graduate students as well as researchers in math and some in biology who wanted to learn about this field.
