Hazard Analysis and Validation Metrics Framework for System of Systems Software Safety

James Bret Michael, *Senior Member, IEEE*, Man-Tak Shing, *Senior Member, IEEE*, Kristian John Cruickshank, and Patrick James Redmond

Abstract—Safety-critical software-intensive systems of systems require rigorous verification and validation to ensure that they function as per requirements. Unlike verification, validation is typically an ill-defined activity for software development. This paper presents a well-defined validation metrics framework which uses hazard analysis, and the derived software requirements for mitigating the identified hazards, as proxies in gauging the sufficiency of the software safety requirements early in the software development process. Moreover, traditional hazard analysis techniques are insufficient to deal with the complexity and size of systems of systems. This paper examines the nature and types of hazards associated with systems of systems and presents a new technique for analyzing one type of emergent hazard known as an interface hazard.

Index Terms—Goal question metric, goal structuring notation, hazard analysis, interface hazard, safety, software, system of systems, validation metrics.

I. INTRODUCTION

SOFTWARE has a growing, even predominant role in automating the decisions taken in safety-critical systems, including large-scale weapon systems (e.g., command of missile launchers via an engage-on-remote capability). Current and future generations of military capabilities require dependable systems of systems (SoSs) that integrate multiple software applications along with many physical systems. SoS must address all safety hazards before deploying the final system. One approach to risk management is Hazard Analysis (HA). HA techniques for SoS must address both the size and complexity of a SoS, and include defined practices that allow an engineer to keep pace with the evolution of a SoS over its lifecycle. These practices must cover the full scope of a SoS; they support both design and analysis to clarify what risks and hazards in a SoS may have been overlooked. HA answers the question for a SoS, "What are the known and possible residual hazards in this system?"

Hazard Analysis, as applied in this paper, also plays an important role in the practice of Software System Safety; this practice depends on a set of management and engineering activities from the System Safety and Software Engineering domains. The intent is to identify, analyze, design, and track software mitigation and control of hazards and hazardous functions [1]. Effective analysis of the safety of software requires the engineer to work within the system context in which the software is executing. Therefore, the Software System Safety Engineering process typically starts with the System Safety Engineering activities to identify potential hazards at the System Engineering level. In this case, potential hazards and safety-critical functions are traced through high-level design and architecture, and ends with validation and verification (V&V) of software safety features required for controlling the hazard casual factors. (Readers can refer to [2] for definitions of error, failure, mishap, hazard, hazard casual factor and risk.)

In [3], Weaver identified the sufficiency of hazard identification and the adequacy of hazard analysis to identify software's role in causing these hazards as two important considerations in constructing a safety case. He also advocated the use of traceability from the derived software safety requirements to the identified system hazards as an indication of the completeness of the set of software safety requirements. Measuring the affects of software on system safety is a relatively unexplored aspect of software engineering. In [4], Basili *et al.* presented an approach for developing software safety measures to gain early insights into potential safety problems and risks. While the metrics suggested in [4] cannot provide proof or validation of the software safety requirements, they can be used to identify potential weakness in the software system safety process and an associated likelihood that the system will not be safe.

This paper addresses the need for management to assess the adequacy of the software safety engineering process. It focuses on the contribution of software toward the safety afforded by SoSs and builds upon Weaver's and Basili's work by introducing a means for measuring the sufficiency of software safety requirements with a set of metrics derived from the hazard identification, hazard analysis, and requirements traceability artifacts. We present a Validation Metrics Framework for management to gauge the sufficiency of the software safety requirements early in the software development process. The framework describes a validation process in which the software safety engineering team acts as an advocate for safety on behalf of the stakeholders (Fig. 1). It complements the traditional methods of

A Validation Metrics Framework For Safety Critical Software Intensive Systems:

 A Validation Metrics Framework for Safety-critical Software-intensive Systems Kristian John Cruickshank,2009 Validation of safety critical software requirements is a difficult and frequently misunderstood task It answers the question of are we building the right product and is essential to Software Engineering However validation is often confused with verification activities or simply left as a final tick in the box just prior to delivery Current models for validation cannot satisfy the unique aspects of safety critical software where building the right safety product is paramount Software safety requires a new model for validation of safety requirements by proxy The need for a proxy model becomes evident in the software safety process where customer input for safety is reduced to the requirement of a safe system This thesis defines a new proactive model for validation of safet critical software requirements Continuous assessment of validity of safety requirements is indicated by metrics as part of the Validation Metrics Framework The generic framework combines the Goal Question Metric Approach with Goal Structuring Notation and then specializes in validation of safety critical software The metrics are measurements of safety products typical to safety critical software development programs A fictitious case study of a Rapid Action Surface to Air Missile is used to apply the framework identifying the benefits of a proactive indicative validation technique utilizing a metrics framework   **Requirements Engineering: Foundation for Software Quality** Eric Knauss,Michael Goedicke,2019-03-11 This book constitutes the proceedings of the 25th International Working Conference on Requirements Engineering Foundation for Software Quality REFSQ 2019 held in Essen Germany in March 2019 The 13 full papers and 9 short papers in this volume were carefully reviewed and selected from 66 submissions The papers were organized in topical sections named Automated Analysis Making Sense of Requirements Tracelink Quality Requirements Management Research Previews From Vision to Specification Automated Analysis Research Previews Requirements Monitoring Open Source Managing Requirements Knowledge at a Large Scale in Situ Walkthroughs Research previews   Software Technologies for Embedded and Ubiquitous Systems Roman Obermaisser,Yunmook Nah,Peter Puschner,Franz J.
