# Artificial Intelligence A Modern Approach 3rd Edition

## Solution Manual

### *Solutions for Chapter 1*

### Introduction

#### 1.1

- a. Dictionary definitions of **intelligence** talk about “the capacity to acquire and apply knowledge” or “the faculty of thought and reason” or “the ability to comprehend and profit from experience.” These are all reasonable answers, but if we want something quantifiable we would use something like “the ability to apply knowledge in order to perform better in an environment.”
- b. We define **artificial intelligence** as the study and construction of agent programs that perform well in a given environment, for a given agent architecture.
- c. We define an **agent** as an entity that takes action in response to percepts from an environment.
- d. We define **rationality** as the property of a system which does the “right thing” given what it knows. See Section 2.2 for a more complete discussion. Both describe perfect rationality, however; see Section 27.3.
- e. We define **logical reasoning** as the a process of deriving new sentences from old, such that the new sentences are necessarily true if the old ones are true. (Notice that does not refer to any specific syntax or formal language, but it does require a well-defined notion of truth.)

#### 1.2 See the solution for exercise 26.1 for some discussion of potential objections.

The probability of fooling an interrogator depends on just how unskilled the interrogator is. One entrant in the 2002 Loebner prize competition (which is not quite a real Turing Test) did fool one judge, although if you look at the transcript, it is hard to imagine what that judge was thinking. There certainly have been examples of a chatbot or other online agent fooling humans. For example, see See Lenny Foner’s account of the Julia chatbot at [foner.www.media.mit.edu/people/foner/Julia/](http://foner.www.media.mit.edu/people/foner/Julia/). We’d say the chance today is something like 10%, with the variation depending more on the skill of the interrogator rather than the program. In 50 years, we expect that the entertainment industry (movies, video games, commercials) will have made sufficient investments in artificial actors to create very credible impersonators.

**1.3** Yes, they are rational, because slower, deliberative actions would tend to result in more damage to the hand. If “intelligent” means “applying knowledge” or “using thought and reasoning” then it does not require intelligence to make a reflex action.

**Manual of Romance Forensic Linguistics** Victoria Guillén-Nieto, Dieter Stein, 2025-06-02. It is evident that published serious science-based work in Forensic Linguistics is predominantly written in English and focuses on casework from the English-speaking world. While the first aspect is understandable given that English serves as an international lingua franca in scientific discourse, the second aspect presents a significant limitation for the field. Should researchers assume that there is simply less crime in non-English speaking areas of the world? A more pertinent question might be: What cultural, disciplinary, legal, or legal-cultural factors contribute to the lack of research in and on languages other than English? In addition to addressing the underrepresentation of Romance languages in scientific publications related to forensic work, the chapters in this handbook will also explore the reasons behind this unfortunate situation. Designed to engage readers, whether they are linguists, legal professionals, or simply interested individuals, and to spark interest in Romance Forensic Linguistics, this handbook follows three key objectives. First, we are committed to providing a comprehensive overview of the casework and research conducted in and on several Romance languages, including Peninsular Spanish, Catalan, Brazilian Portuguese, French, Canadian French, Italian, and Romanian. Second, the chapters in this volume seek to understand why Forensic Linguistics has thrived more in some Romance-speaking countries than in others. Finally, we aim to uncover the reasons for the slower development of Forensic Linguistics in regions where Romance languages are predominantly spoken.

Decision making arises when we wish to select the best possible course of action from a set of alternatives. With advancements of the digital technologies it is easy and almost instantaneous to gather a large volume of information and or data pertaining to a problem that we want to solve. For instance the world wide web is perhaps the primary source of information and or data that we often turn to when we face a decision making problem. However the information and or data that we obtain from the real world often are complex and comprise various kinds of noise. Besides real world information and or data often are incomplete and ambiguous owing to uncertainties of the environments. All these make decision making a challenging task. To cope with the challenges of decision making searchers have designed and developed a variety of decision support systems to provide assistance in human decision making processes. The main aim of this book is to provide a small collection of techniques stemmed from artificial intelligence as well as other complementary methodologies that are useful for the design and development of intelligent decision support systems. Application examples of how these intelligent decision support systems can be utilized to help tackle a variety of real world problems in different domains e.g. business management, manufacturing, transportation and food industries and biomedicine are also presented.
