“THE BEAKS OF FINCHES” LAB

INTRODUCTION

Environmental conditions act as selecting agents because they select organisms with the most beneficial traits to become the parents of the next generation. Within a species, individuals with variations that make them better adapted to their environment will survive and reproduce in greater numbers than those without such adaptations. Observations have shown that the offspring of better-adapted individuals inherit many of their parents' favorable variations.

Finches are small birds found in many locations throughout the world. Charles Darwin used the numerous finch species found on the Galapagos Islands as evidence of natural selection. The great variety of beak adaptations present on the Galapagos is thought to be due to the isolation of bird populations on the islands with different kinds and amounts of food. Seed-eating finches exhibit a great number of differences in beak shapes and sizes. During ongoing competition for resources, some finches are successful and become more numerous, while less successful finches decrease in number.

In this laboratory activity, you will work with different tools that will serve to model finch “beaks”. The seeds provided represent finch food on a particular island. You will compete with other “finch” species to see which “beak” is best adapted for obtaining a specific food.

Figure 1. Variations in Beaks of Galapagos Islands Finches

HYPOTHESIS:

1. Examine the different tools (“beaks”) and seeds provided. Predict which “beak” will be the *most* successful at picking up small seeds. Give the reasons for your choice.

2. Predict which “beak” will be the *least* successful at picking up small seeds. Give the reasons for your choice.

ROUND ONE: No Competition, Original Island

- When given the “Round One” signal, one member of your team should use the “beak” to pick up small seeds one at a time from the large dish and place them in the small dish. Repeat this for a total of four trials, two trials for each partner. A timekeeper will tell you when to start and stop each trial. Record your results in the “Round One: Feeding with No Competition” data table.

Modes of Learning George Allan, 2012-05-18 Educators are familiar with Alfred North Whitehead's three stages of education: romance, precision, and generalization. Philosophers are familiar with his metaphysical theories about the primacy of temporal processes. In *Modes of Learning*, George Allan brings these two sides of Whitehead's thought together for the first time in a book suitable for both those initially approaching Whitehead's metaphysics and experts alike. Allan develops a series of analogies between Whitehead's ideas about how we learn and key concepts in his later metaphysical writings, demonstrating that both how we learn and how the world changes involve a tension between open-ended exploration and systematic organization. Novel ideas free us from the blinders imposed by old habits and beliefs. Yet only when these ideas are integrated with the old ways are we able to improve our individual and collective lives until changing circumstances call for further new ideas and fresh integrations. Using a rich variety of examples, Allan illuminates the metaphysical ideas he explores by tethering them concretely to the educational practices in which they are rooted. This shows a key but neglected feature of Whitehead's thought: his pragmatic theory of truth with its functionalist approach to experience and its humanistic appreciation of the frailty of all human endeavors.

Wedding of the Foxes Katherine Larson, 2025-07-15 Larson's writing is brilliant tonic even amidst the flames. Especially amidst the flames, I'm grateful for it. Rick Bass, author of *With Every Great Breath*. From celebrated poet and ecologist Katherine Larson, an elegant collection of lyric essays that embraces fractures, contradictions, and the interconnectedness of life on Earth. Raising two children, coping with pandemic isolation, and grappling with the magnitude of the current extinction crisis, Katherine Larson finds herself in need of an antidote for despair. This is when Larson encounters kintsugi, the art of repairing broken pottery with gold-dusted lacquer. *Wedding of the Foxes* borrows from this ancient practice to create a new interpretative framework, one that seeks beauty in both breakage and unexpected connections. Here, Larson juxtaposes the elaborate courtship dance of sandhill cranes with scientific reports on diminishing avian populations to shed light on the urgency of climate crisis. She braids the wisdoms of a wonderfully varied range of forebears and predecessors: Gaston Bachelard, Tawada Yoko, Francis Ponge, who share her dream of a liberated consciousness. She weaves Susan Sontag's examinations of cinematic disaster with the legacy of Godzilla to highlight nature as both savior and destroyer, and she writes letters to Japanese women writers whose work has taught her new ways of being. Each of these disparate parts comes together to highlight the beauty in what falls through the cracks and blurs into other moments. Brimming with the dazzling yet fragile relationships we share with each other and with other species, these lush microcosms invite us to embrace resilience and mindfulness and the illuminating truth of our connections.

New Scientist, 1999 **Mate Choice** Gil G. Rosenthal, 2017-07-18 A major new look at the evolution of mating decisions in organisms from protozoans to humans The popular consensus on mate choice has long been that females select mates likely to pass good genes to offspring In Mate Choice Gil Rosenthal overturns much of this conventional wisdom Providing the first synthesis of the topic in more than three decades and drawing from a wide range of fields including animal behavior evolutionary biology social psychology neuroscience and economics Rosenthal argues that good genes play a relatively minor role in shaping mate choice decisions and demonstrates how mate choice is influenced by genetic factors environmental effects and social interactions Looking at diverse organisms from protozoans to humans Rosenthal explores how factors beyond the hunt for good genes combine to

produce an endless array of preferences among species and individuals He explains how mating decisions originate from structural constraints on perception and from nonsexual functions and how single organisms benefit or lose from their choices Both the origin of species and their fusion through hybridization are strongly influenced by direct selection on preferences in sexual and nonsexual contexts Rosenthal broadens the traditional scope of mate choice research to encompass not just animal behavior and behavioral ecology but also neurobiology the social sciences and other areas Focusing on mate choice mechanisms rather than the traits they target Mate Choice offers a groundbreaking perspective on the proximate and ultimate forces determining the evolutionary fate of species and populations **Connecticut Wildlife** ,1999 The Software Encyclopedia 2000 Bowker Editorial Staff,2000-05
