Dynamic Urban Transportation Network Models Bin Ran, David Boyce, 2012-12-06. Intelligent Vehicle Highway Systems are providing a welcome stimulus to research on dynamic urban transportation network models. This book presents a new generation of models for solving dynamic travel choice problems including traveler's destination choice, mode choice, departure arrival time choice and route choice. These models are expected to function as off line travel forecasting and evaluation tools and eventually as on line prediction and control models in advanced traveler information and traffic management systems. In addition to a rich set of new formulations and solution algorithms the book provides a summary of the necessary mathematical background and concludes with a discussion of the requirements for model implementation.

range of problems encountered by civil and environmental engineers In this groundbreaking text reference the world's leading experts describe sophisticated OR applications across the spectrum of environmental and civil engineering specialties addressing problems encountered in both operation and design **Subject Guide to Books in Print**, 1993

Modeling Dynamic Transportation Networks Bin Ran, David Boyce, 2012-12-06 This book seeks to summarize our recent progress in dynamic transportation network modeling It concentrates on ideal dynamic network models based on actual travel times and their corresponding solution algorithms In contrast our first book *Dynamic Urban Transportation Network Models: Theory and Implications for Intelligent Vehicle Highway Systems* Springer Verlag 1994 focused on instantaneous dynamic network models Comparing the two books the major differences can be summarized as follows 1 This book uses the variational inequality problem as the basic formulation approach and considers the optimal control problem as a subproblem for solution purposes The former book used optimal control theory as the basic formulation approach which caused critical problems in some circumstances 2 This book focuses on ideal dynamic network models based on actual travel times The former book focused on instantaneous dynamic network models based on currently prevailing travel times 3 This book formulates a stochastic dynamic route choice model which can utilize any possible route choice distribution function instead of only the logit function 4 This book reformulates the bilevel problem of combined departure time route choice as a one level variational inequality 5 Finally a set of problems is provided for classroom use In addition this book offers comprehensive insights into the complexity and challenge of applying these dynamic network models to Intelligent Transportation Systems ITS Nevertheless the models in this text are not yet fully evaluated and are subject to revision based on future research
