

Bayesian Survival Analysis Using Log-Linear Median Regression Models

Jianchang Lin, Debajyoti Sinha, Stuart Lipsitz, and Adriano Polpo

Abstract For the analysis of survival data from clinical trials, the popular semi-parametric models such as Cox's (1972) proportional hazards model and linear transformation models (Cheng et al. 1995) usually focus on modeling effects of covariates on the hazard ratio or the survival response. Often, there is substantial information available in the data to make inferences about the median/quantiles. Models based on the median/quantiles (Ying et al. 1995) survival have been shown to be useful in for describing covariate effects. In this paper, we present two novel survival models with log-linear median regression functions. These two wide classes of semiparametric models have many desirable properties including model identifiability, closed form expressions for all quantile functions, and nonmonotone hazards. Our models also have many important practical advantages, including the ease of determination of priors, a simple interpretation of the regression parameters via the ratio of median survival times, and the ability to address heteroscedasticity of survival response. We illustrate the advantages of proposed methods through extensive simulation studies investigating small sample performance and robustness

Resampling Methods for Dependent Data S. N. Lahiri, 2013-03-09 This is a book on bootstrap and related resampling methods for temporal and spatial data exhibiting various forms of dependence Like the resampling methods for independent data these methods provide tools for statistical analysis of dependent data without requiring stringent structural assumptions This is an important aspect of the resampling methods in the dependent case as the problem of model misspecification is more prevalent under dependence and traditional statistical methods are often very sensitive to deviations from model assumptions Following the tremendous success of Efron's 1979 bootstrap to provide answers to many complex problems involving independent data and following Singh's 1981 example on the inadequacy of the method under dependence there have been several attempts in the literature to extend the bootstrap method to the dependent case A breakthrough was achieved when resampling of single observations was replaced with block resampling an idea that was put forward by Hall 1985 Carlstein 1986 Kiinsch 1989 Liu and Singh 1992 and others in various forms and in different inference problems There has been a vigorous development in the area of resampling methods for dependent data since then and it is still an area of active research This book describes various aspects of the theory and methodology of resampling methods for dependent data developed over the last two decades There are mainly two target audiences for the book with the level of exposition of the relevant parts tailored to each audience

Unified Methods for Censored Longitudinal Data and Causality Mark J. van der Laan, James M Robins, 2012-11-12 During the last decades there has been an explosion in computation and information technology This development comes with an expansion of complex observational studies and clinical trials in a variety of fields such as medicine biology

epidemiology sociology and economics among many others which involve collection of large amounts of data on subjects or organisms over time The goal of such studies can be formulated as estimation of a finite dimensional parameter of the population distribution corresponding to the observed time dependent process Such estimation problems arise in survival analysis causal inference and regression analysis This book provides a fundamental statistical framework for the analysis of complex longitudinal data It provides the first comprehensive description of optimal estimation techniques based on time dependent data structures subject to informative censoring and treatment assignment in so called semiparametric models Semiparametric models are particularly attractive since they allow the presence of large unmodeled nuisance parameters These techniques include estimation of regression parameters in the familiar multivariate generalized linear regression and multiplicative intensity models They go beyond standard statistical approaches by incorporating all the observed data to allow for informative censoring to obtain maximal efficiency and by developing estimators of causal effects It can be used to teach masters and Ph D students in biostatistics and statistics and is suitable for researchers in statistics with a strong interest in the analysis of complex longitudinal data
