accounts for more days of hospitalization than diabetes heart attacks or breast cancer Fractures are also directly responsible for a 30% increase in mortality in the first year after the incidence While the underlying cause of fragility fracture is osteoporosis and a previous fracture increases the risk of the following fracture by nearly twofold in men and women only 9% 50% of patients with fragility fractures have formal bone health assessment and treatments According to a systematic review bone density scans were ordered only for 1 to 32% of adults who experience a fragility fracture Furthermore post hip fracture mortality rates vary between 25 30% in western countries and 2 3 folds higher in populations from the Middle East and Africa region Sarcopenia is a syndrome defined by loss of skeletal muscle mass and strength that gradually progresses by age and it is severely correlated with poor quality of life dependency and mortality Documents showed that loss of muscle mass is associated with a higher duration of hospitalization and costs The direct health care cost attributed to sarcopenia in U S A was estimated at 18 5 billion for the year 2000 1 5% of the total healthcare expenditure The progressive loss in bone mineral density muscle mass and strength are significant features of the aging process and the economic burden seems to significantly increase by the worldwide population aging Osteosarcopenia defined by the presence of sarcopenia and bone loss can lead to higher clinical outcomes such as falls and fractures while the information regarding this progressively increased geriatric syndrome is scarce Despite the preventable nature of osteoporosis sarcopenia and osteosarcopenia and related complications loss of accurate information on the distribution of related risk factors leftovers a major concern for policymakers in some countries and expanding appropriate interventions should be prioritized To do this a precise depiction of the situation determination of the related risk factors in detail providing acceptable strategies for prevention and treatment are required The number of people living with dependency is set to dramatically increase in the coming decades due to aging populations and lifestyle changes Musculoskeletal disorders are amongst the most impactful ailments that result in the inability to live independently The forthcoming growth in the number of people living with dependency will place significantly greater demands on our systems of care Despite much research for slowing the decline and prevention of related complications lack of accurate information on the risk factors pose a major roadblock for policymakers in some countries as implementation of appropriate interventions needs to be prioritized For these reasons precise diagnosis of these disabilities their underlying risk factors and proven strategies for prevention and treatment need definition **Henry's**
