Describe the following propagation methods of air layering, tissue culture, stem cuttings, leaf cuttings, root cuttings, & seeds. -Answer- Air layering is a method of propagating new trees and shrubs from stems still attached to the parent plant. The stem is wrapped with damp moss to encourage roots to form.

Plant tissue culture is a collection of techniques used to maintain or grow plant cells, tissues or organs under sterile conditions on a nutrient culture medium of known composition. It is widely used to produce clones of a plant in a method known as micropropagation.

Stem cuttings: It involves taking a section of stem from a parent plant and manipulating it to create a new plant.

leaf cuttings: stem cutting produces new roots, and a root cutting produces new stems

root cuttings: the portion of root is cut from a parent plant (often called a mother plant), placed in a growing medium, and then left to grow its own system of roots and stems.

seeds: is the method of plant propagation (multiplying, reproducing, or breeding new plants) that is done through the use of seeds.
