Treatment Decision after Anterior Cruciate Ligament Injury, and Evaluation of Measurement Properties of a Patient Reported Outcome Measure Hanna Tigerstrand Grevnerts, 2019-11-04 Background After an ACL injury treatment aims to restore knee function Evaluation of treatment progress is important and adequate measurement methods are necessary The International Knee Documentation Committee

Subjective Knee Form IKDC SKF is a common patient reported outcome measure PROM used after ACL injury. It evaluates symptoms, function and physical activity. The IKDC SKF had not been translated to Swedish language for use in Swedish clinical and research settings. The measurement properties of the IKDC SKF had been tested but no assessment of methodological quality of the studies investigating it nor compiling of results was published. Sooner or later after an ACL injury a treatment decision must be made. Treatment options are either ACL reconstruction, ACLR plus rehabilitation or rehabilitation alone. There are guidelines stating that a decision for ACLR should be made if the patient has high activity demands and/or knee instability. It is unclear which factors orthopaedic surgeons and physiotherapists prioritise when recommending ACLR. It is also unclear when the decision for treatment is taken on what grounds and how treatment decision correlates to patients reported symptoms and function.

Aims The overall aim of this thesis was to evaluate the measurement properties of a patient reported measure for evaluation of function after ACL injury and treatment and to overview the treatment decision process after an ACL injury.

Methods A systematic review was conducted to assess the measurement properties of the IKDC SKF. The IKDC SKF was translated from English to Swedish and the Swedish version was tested for reliability, validity, responsiveness and interpretability. A survey study was conducted where 98 orthopaedic surgeons and 391 physiotherapists rated 21 predefined factors based on importance to the decision for ACLR. Orthopaedic surgeons and physiotherapists rated how important they considered their own, their counterparts and patient's wishes for treatment decision making. In a prospective cohort study patients with an ACL injury were followed from within 6 weeks up to 12 months after injury. Data regarding treatment chosen when and why were described and compared to patient reported pre injury activity level, instability and function.

Results The English and Swedish version of the IKDC SKF had good measurement properties and interpretability. Swedish orthopaedic surgeons and physiotherapists considered young age, high activity demands, knee demanding occupation and knee instability despite adequate rehabilitation indications to recommend ACLR. An early decision for ACLR was primarily based on high activity demands. A later decision was mainly due to instability and high activity demands. A decision taken later than five months after injury was based mainly on instability. A decision for non operative treatment taken and maintained during the first 12 months after injury was mainly due to sufficient function or no instability problems and patients were older than other groups.

Conclusions The patient reported outcome measurement IKDC SKF was suitable for evaluation and assessment in patients with ACL injury. ACLR as treatment after an ACL injury was recommended for young patients and/or those with high activity demands, i.e. knee demanding occupation and/or instability despite adequate rehabilitation. An early decision for ACLR was more often based on high activity demands while later decisions were more often based upon perceived instability. Non operative treatment decisions were often based upon lack of instability problems or sufficient knee function. Self reported instability and function during the first three months after ACL injury were no different in patients who chose ACLR treatment or who chose non operative treatment.

fr mer korsbandsskada syftar behandlingen att återställa knäns funktion. Utvärdering av framstegen är av vikt och adekvata metoder för detta är nödvändigt. International Knee Documentation Committee Subjective Knee Form (IKDC SKF) är ett patientskattningsformulär som är välkänt över hela världen vid främre korsbandsskador. Det utvärderar symptom, funktion och fysisk aktivitet. Det har inte funnits tillräckligt många svenska tidigare och det har heller inte funnits någon sammanställning över formulärens måttenheter. Efter en främre korsbandsskada måste förre eller senare beslut om behandling fattas om patienten ska genomgå en rekonstruktionsoperation för främre korsbandet med efterföljande rehabilitering eller enbart rehabilitering. Det finns riktlinjer som gör gällande att en korsbandsrekonstruktion kan vara ett adekvat alternativ när patienten har höga aktivitetskrav eller lider av instabilitet i knäleden. Det är dock ej fastställt vilka faktorer ortopedläkare och fysioterapeuter anser viktiga för att rekommendera rekonstruktionsoperation. Det är inte heller klargjort när efter skada och på vilka grunder faktiska behandlingsbeslut fattas och hur orsaken till beslutet hänger samman med patientens självrapporterade symptom och funktion. Syftet med denna avhandling var att utvärdera måttenheter för ett patientskattningsformulär som utvärderar funktion efter en främre korsbandsskada samt att verblicka beslutsprocessen för behandling efter en främre korsbandsskada. Metod: En systematisk genomgång utfördes av studier som utvärderat måttenheter för IKDC SKF. Studierna värderades avseende metodologi och resultat. IKDC SKF översattes till svenska och den svenska versionens måttenheter prövades. En enkätstudie utfördes där 98 svenska ortopedläkare och 391 svenska fysioterapeuter fick skatta 21 faktors betydelse för valet att rekommendera rekonstruktionsoperation av främre korsbandet. Ortopedläkare och fysioterapeuter fick även skatta vikten av sin egen och motpartens bedömning samt patientens önskan i valet av behandling. I en prospektiv kohortstudie följdes 219 patienter med en främre korsbandsskada från 6 veckor och upp till 12 månader efter skadan. Data om vilken behandling patienten genomgått när behandling valdes och grunder för behandling samlades in från patient och ortopedläkare och jämfördes med patientskattad aktivitetsnivå innan skada, instabilitet och funktion. Resultat: Den systematiska genomgången av IKDC SKF och prövningen av den svenska versionens måttenheter visade att IKDC SKF uppvisar goda måttenheter och gör att tolka i kliniken. Svenska ortopedläkare och fysioterapeuter anser att unga lider höga aktivitetskrav, knäkravande arbete och instabilitet trots adekvat rehabilitering är faktorer som indikerar behov av rekonstruktionsoperation av främre korsbandet. Ett tidigt beslut för rekonstruktionsoperation efter främre korsbandsskada fattas i höga grad på grund av höga aktivitetskrav och dessa patienter har även högre aktivitetsnivå innan skada. Ett senare beslut för rekonstruktionsoperation fattas i höga grad på grund av instabilitet och höga aktivitetskrav medan ett sent beslut fattas i höga grad på grund av instabilitet. Ett beslut att enbart behandla med rehabilitering fattas i höga grad på grund av att patienten har tillräckligt god funktion eller inte har någon grav besvär från instabilitet. Det var inga skillnader i patientskattad funktion och instabilitet mellan de patienter där rekonstruktionsoperation valdes och de som valde att behandla med enbart rehabilitering. Sammanfattning: IKDC SKF visar goda måttenheter och kan rekommenderas för användning hos patienter med en främre korsbandsskada och andra knä
