

Applications of Quadratic Functions

One of the most common applications of quadratic functions is *projectile motion*. When objects are thrown or shot through the air, we can model them with parabolas.

- These functions are often named $h(t)$, **height** as a function of **time**. Even if an object is shot straight up into the air, its graph will still appear to move forward, since *time is always moving forward*!
- Every object in projectile motion has the same force acting upon it: **gravity**. So we will notice similarities in each one of these functions: a leading coefficient of -16 (in feet) or -4.9 (in meters).

A water balloon is launched straight up. The balloon's flight is modeled by the function $h(t) = -16t^2 + 192t$, where $h(t)$ is the height in feet after t seconds. Answer the following questions graphically and algebraically.

Graphically

At what height did the water balloon start?

When did it reach its maximum height?

What was its maximum height?

When did it hit the ground?

Algebraically

At what height did the water balloon start? _____

When did it reach its maximum height? _____

What was its maximum height? _____

When did it hit the ground? _____

* What was its height at 9 seconds?

* Looking at its graph and considering the real-world context of this problem, select the appropriate domain:

A) $-2 \leq t \leq 12$

B) $t \geq 0$

C) $0 \leq t \leq 12$

D) $0 \leq t \leq 15$
