Moreover, the above information about individual systems is often of biological importance in giving insight into a wider range of their various developmental and tissue functional characteristics. In addition, the information provided by the *in situ* fluorescence technique has been of considerable importance in the study of other cell structural properties. An example of this work has been discussed in this paper, where the specific production of single new binding and binding sites for the polynuclear aromatic hydrocarbon type fluorescent probe, 3,3'-diethyl-6,6'-dibenzofluoranthenes, has been demonstrated with a 100% yield. However, this method of labeling has been successfully applied to various cell systems.

These findings point to the authors' conclusion that water should be regarded as a public good. It is not possible to charge users for water and hence it requires a charge that is non-excludable for water users. Furthermore, water is a shared resource and should be managed as such.
