

Left Pathway: Cardiovascular Risk Reduction & Glycaemic Control

- Initial Assessment:**
 - <ASCTP***: Select already used DPP-4i but if selected combination with established CVD (e.g., ACE-inhibitor, angiotensin receptor antagonist, statin, or treated ischemic stroke, cardiac failure, peripheral vascular disease, chronic kidney disease, atrial fibrillation, angina pectoris, myocardial infarction, coronary artery disease).
 - Indicators of High Risk**: HbA_{1c} indicates very poor control or CVD present or type with low or more additional risk factors (including family hypercholesterolemia, smoking, dyslipidemia or alcoholism).
- Decision Point:**
 - If **<ASCTP*** with proven CVD benefit: Consider adding SGLT-1/2i with proven CVD benefit or vice versa.
 - If **<ASCTP*** with proven CVD benefit: If BSL₀ above target, consider adding SGLT-1/2i with proven CVD benefit or vice versa.
- Outcome:** If additional cardiovascular risk reduction or glycaemic lowering needed.

Right Pathway: Dynamic Management & Weight Management Goals

- Dynamic Management:** Choose approaches that provide the efficacy to achieve goals. Metabolic DI Agents (including GLP-1R agonists) emerge that provide adequate EFFACY to achieve and maintain treatment goals. Consider evidence of hypoglycaemia as priority in high-risk individuals.
- Weight Management:** Achievements and Maintenance of Weight Management Goals. Individualized weight management goals. General therapy advice: medical nutrition, behavior change, physical activity. Intensive evidence-based structured weight management programs. Consider medication for weight loss. Consider metabolic surgery.
- Glycaemic Targets:** In general, higher efficacy approaches have greater likelihood of achieving glycaemic goals. Efficacy for glucose lowering: Very High (Dapagliflozin, High Dose, Semaglutide, Tirzepatide), Moderate (Canagliflozin, Low Dose, Combination Insulin/GLP-1 R Agonist), High (SGLT-1/2i best listed alone, Metformin, GLP-1 R Agonists, TZDs), Intermediate (DPP-4i).
 - When choosing glucose-lowering therapies:** Consider regimen with high-to-very-high dose glucose and weight efficacy.
 - Efficacy for weight loss:** Very High (Semaglutide, Tirzepatide), High (Dapagliflozin, Linagliptin), Intermediate (SGLT-1/2i best listed alone, GLP-1 R Agonists), Neutral (DPP-4i, Metformin).
- Outcome:** If BSL₀ above target.

Footnote: *In people without CVD, additional therapy multiple the benefits for CVD. For benefits to see a SGLT-1/2i with SGLT-1/2i with proven benefit should be independent of background use of metformin. A strong recommendation is restricted to people with CVD and a weaker recommendation for those with indication of high CVD risk. However, stronger evidence that reduction and four lower numbers needed to treat are seen at higher levels of baseline risk and should be followed from the shared decision making process. Fearful for Safety: 1 Less than 100 may be better tolerated and stability of safety 5 for SGLT-1/2i oral outcomes thus demonstrate their efficacy by reducing the rate of composite MACE, CV death, all cause mortality, MI, HFr and most outcomes in individuals with CVD with uncontrolled high risk of CVD. In the SGLT-1/2i, DPP-4i demonstrate their efficacy by reducing composite MACE, CV death, all cause mortality, MI, major and minor outcomes in individuals with CVD with uncontrolled high risk of CVD.
